

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

- **Excellent Price/Performance Digital Signal Processors (DSPs): TMS320C62x™ (TMS320C6211 and TMS320C6211B)**
 - Eight 32-Bit Instructions/Cycle
 - C6211, C6211B, C6711, and C6711B are Pin-Compatible
 - 150-, 167-MHz Clock Rates
 - 6.7-, 6-ns Instruction Cycle Time
 - 1200, 1333 MIPS
 - Extended Temperature Device (C6211B)
- **VelociTI™ Advanced Very Long Instruction Word (VLIW) C62x™ DSP Core (C6211/11B)**
 - Eight Highly Independent Functional Units:
 - Six ALUs (32-/40-Bit)
 - Two 16-Bit Multipliers (32-Bit Results)
 - Load-Store Architecture With 32 32-Bit General-Purpose Registers
 - Instruction Packing Reduces Code Size
 - All Instructions Conditional
- **Instruction Set Features**
 - Byte-Addressable (8-, 16-, 32-Bit Data)
 - 8-Bit Overflow Protection
 - Saturation
 - Bit-Field Extract, Set, Clear
 - Bit-Counting
 - Normalization
- **L1/L2 Memory Architecture**
 - 32K-Bit (4K-Byte) L1P Program Cache (Direct Mapped)
 - 32K-Bit (4K-Byte) L1D Data Cache (2-Way Set-Associative)
 - 512K-Bit (64K-Byte) L2 Unified Mapped RAM/Cache (Flexible Data/Program Allocation)
- **Device Configuration**
 - Boot Mode: HPI, 8-, 16-, and 32-Bit ROM Boot
 - Endianness: Little Endian, Big Endian
- **32-Bit External Memory Interface (EMIF)**
 - Glueless Interface to Asynchronous Memories: SRAM and EPROM
 - Glueless Interface to Synchronous Memories: SDRAM and SBSRAM
 - 512M-Byte Total Addressable External Memory Space
- **Enhanced Direct-Memory-Access (EDMA) Controller (16 Independent Channels)**
- **16-Bit Host-Port Interface (HPI)**
 - Access to Entire Memory Map
- **Two Multichannel Buffered Serial Ports (McBSPs)**
 - Direct Interface to T1/E1, MVIP, SCSPA Framers
 - ST-Bus-Switching Compatible
 - Up to 256 Channels Each
 - AC97-Compatible
 - Serial-Peripheral-Interface (SPI) Compatible (Motorola™)
- **Two 32-Bit General-Purpose Timers**
- **Flexible Phase-Locked-Loop (PLL) Clock Generator**
- **IEEE-1149.1 (JTAG†) Boundary-Scan-Compatible**
- **256-Pin Ball Grid Array (BGA) Package (GFN Suffix)**
- **0.18-μm/5-Level Metal Process**
 - CMOS Technology
- **3.3-V I/Os, 1.8-V Internal**

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

description

The TMS320C62x™ DSPs (including the TMS320C6211/C6211B devices) compose one of the fixed-point DSP families in the TMS320C6000™ DSP platform. The TMS320C6211 (C6211) and TMS320C6211B (C6211B) devices are based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications.

With performance of up to 1333 million instructions per second (MIPS) at a clock rate of 167 MHz, the C6211/C6211B device offers cost-effective solutions to high-performance DSP programming challenges. The C6211/C6211B DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide six arithmetic logic units (ALUs) for a high degree of parallelism and two 16-bit multipliers for a 32-bit result. The C6211/C6211B can produce two multiply-accumulates (MACs) per cycle for a total of 333 million MACs per second (MMACS). The C6211/C6211B DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6211/C6211B uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 32-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 32-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 512-Kbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, a host-port interface (HPI), and a glueless external memory interface (EMIF) capable of interfacing to SDRAM, SBRAM and asynchronous peripherals.

The C6211/C6211B has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

device characteristics

Table 1 provides an overview of the C6211/C6211B DSP. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count. For more details on the C6000™ DSP device part numbers and part numbering, see Table 17 and Figure 4.

device compatibility

The TMS320C6211/C6211B and C6711/C6711B devices are pin-compatible and have the same peripheral set; thus, making new system designs easier and providing faster time to market. The following list summarizes the device characteristic differences among the C6211, C6211B, C6711, and C6711B devices:

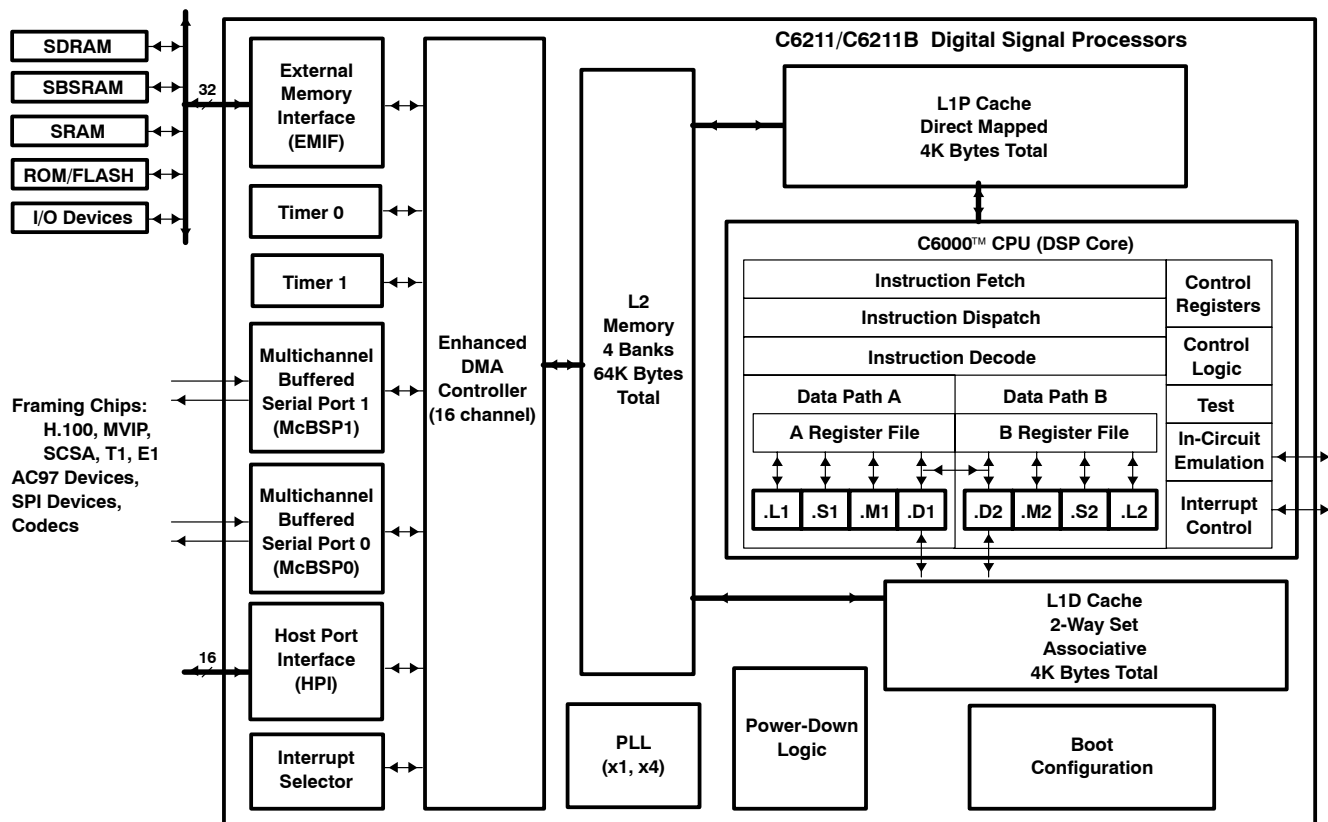

- The C6211 and C6211B devices have a fixed-point C62x CPU, while the C6711 and C6711B devices have a floating-point C67x CPU.
- The C6211/C6211B device runs at -167 and -150 MHz clock speeds (with a C6211BGFNA extended temperature device that also runs at -150 MHz), while the C6711/C6711B device runs at -150 and -100 MHz (with a C6711BGFNA extended temperature device that also runs at -100 MHz).

For a more detailed discussion on the similarities/differences between the C6211 and C6711 devices, see the *How to Begin Development Today with the TMS320C6211 DSP* and *How to Begin Development with the TMS320C6711 DSP* application reports (literature number SPRA474 and SPRA522, respectively).

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

functional block and CPU (DSP core) diagram

CPU (DSP core) description

The CPU fetches VelociTI™ advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI™ VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C62x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU (see the functional block and CPU diagram and Figure 1). The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

Another key feature of the C62x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C62x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

CPU (DSP core) description (continued)

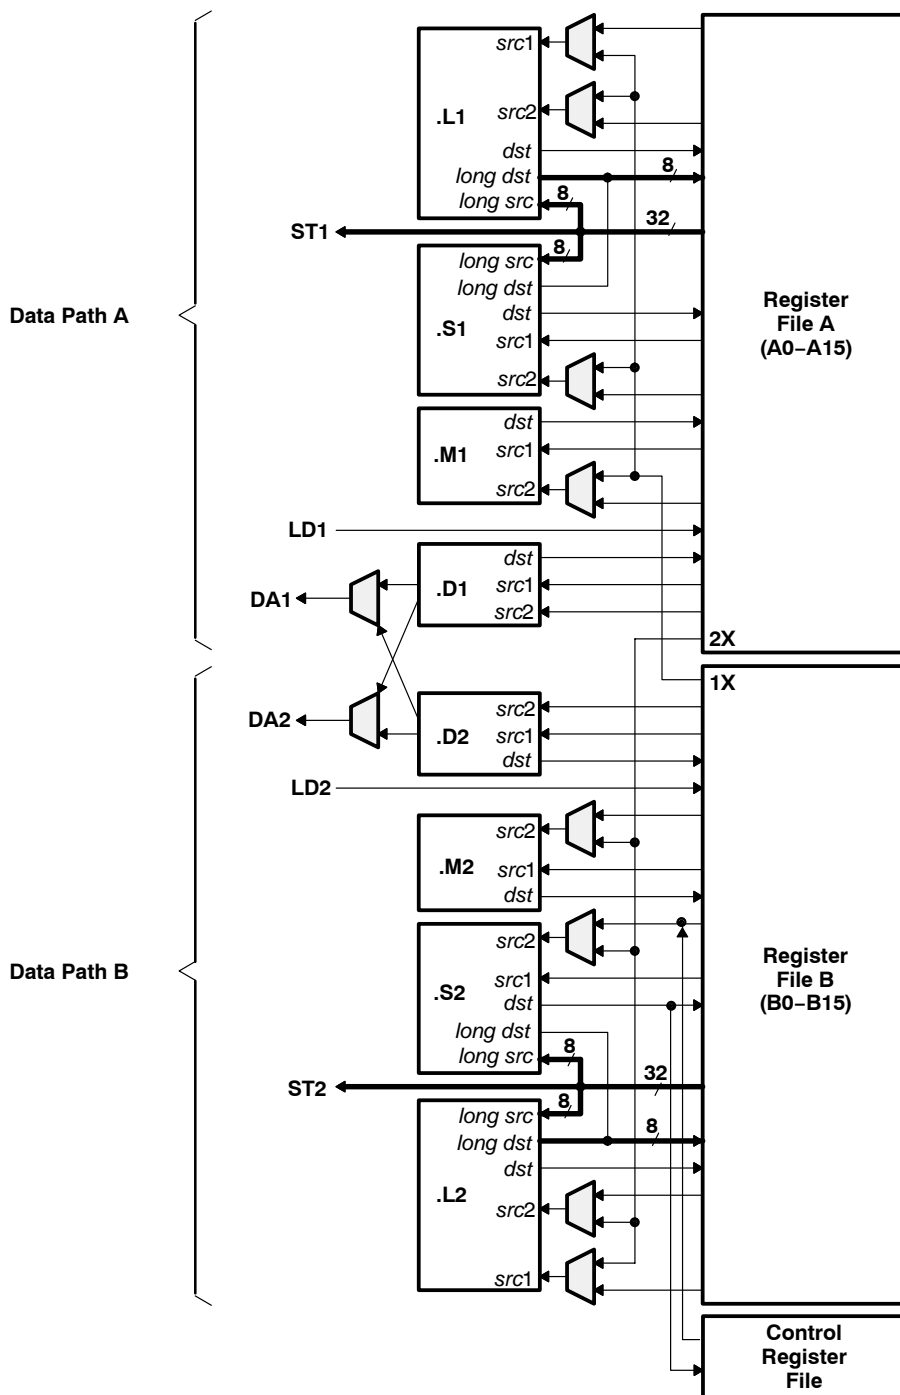

Figure 1. TMS320C62x™ CPU (DSP Core) Data Paths

memory map summary

Table 2 shows the memory map address ranges of the C6211/C6211B devices. Internal memory is always located at address 0 and can be used as both program and data memory. The C6211/C6211B configuration registers for the common peripherals are located at the same hex address ranges. The external memory address ranges in the C6211/C6211B devices begin at the address location 0x8000 0000.

Table 2. TMS320C6211/C6211B Memory Map Summary

| MEMORY BLOCK DESCRIPTION | BLOCK SIZE (BYTES) | HEX ADDRESS RANGE |
|--|--------------------|-----------------------|
| Internal RAM (L2) | 64K | 0000 0000 – 0000 FFFF |
| Reserved | 24M – 64K | 0001 0000 – 017F FFFF |
| External Memory Interface (EMIF) Registers | 256K | 0180 0000 – 0183 FFFF |
| L2 Registers | 256K | 0184 0000 – 0187 FFFF |
| HPI Registers | 256K | 0188 0000 – 018B FFFF |
| McBSP 0 Registers | 256K | 018C 0000 – 018F FFFF |
| McBSP 1 Registers | 256K | 0190 0000 – 0193 FFFF |
| Timer 0 Registers | 256K | 0194 0000 – 0197 FFFF |
| Timer 1 Registers | 256K | 0198 0000 – 019B FFFF |
| Interrupt Selector Registers | 256K | 019C 0000 – 019F FFFF |
| EDMA RAM and EDMA Registers | 256K | 01A0 0000 – 01A3 FFFF |
| Reserved | 6M – 256K | 01A4 0000 – 01FF FFFF |
| QDMA Registers | 52 | 0200 0000 – 0200 0033 |
| Reserved | 736M – 52 | 0200 0034 – 2FFF FFFF |
| McBSP 0/1 Data | 256M | 3000 0000 – 3FFF FFFF |
| Reserved | 1G | 4000 0000 – 7FFF FFFF |
| EMIF CE0 [†] | 256M | 8000 0000 – 8FFF FFFF |
| EMIF CE1 [†] | 256M | 9000 0000 – 9FFF FFFF |
| EMIF CE2 [†] | 256M | A000 0000 – AFFF FFFF |
| EMIF CE3 [†] | 256M | B000 0000 – BFFF FFFF |
| Reserved | 1G | C000 0000 – FFFF FFFF |

[†] The number of EMIF address pins (EA[21:2]) limits the maximum addressable memory (SDRAM) to 128MB per CE space. To get 256MB of addressable memory, additional general-purpose output pin or external logic is required.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

peripheral register descriptions

Table 3 through Table 13 identify the peripheral registers for the C6211/C6211B device by their register names, acronyms, and hex address or hex address range. For more detailed information on the register contents, bit names, and their descriptions, see the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190).

Table 3. EMIF Registers

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME |
|-----------------------|---------|----------------------------|
| 0180 0000 | GBLCTL | EMIF global control |
| 0180 0004 | CECTL1 | EMIF CE1 space control |

| 0188 0001 – 018B FFFF | – | Reserved | |

PWRD bits in CPU CSR register description

Table 14 identifies the PWRD field (bits 15–10) in the CPU CSR register. These bits control the device power-down modes. For more detailed information on the PWRD bit field of the CPU CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Table 14. PWRD field bits in the CPU CSR Register

| HEX ADDRESS RANGE | ACRONYM | REGISTER NAME | COMMENTS |
|-------------------|---------|-------------------------|--|
| – | CSR | Control status register | The PWRD field (bits 15–10 in the CPU CSR) controls the device power-down modes. Accessible by writing a value to the CSR register. |

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

EDMA channel synchronization events

The C62x EDMA supports up to 16 EDMA channels. Four of the sixteen channels (channels 8–11) are reserved for EDMA chaining, leaving 12 EDMA channels available to service peripheral devices. Table 15 lists the source of synchronization events associated with each of the programmable EDMA channels. For the C6211/11B, the association of an event to a channel is fixed; each of the EDMA channels has one specific event associated with it. For more detailed information on the EDMA module, associated channels, and event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

Table 15. TMS320C6211/C6211B EDMA Channel Synchronization Events

| EDMA CHANNEL | EVENT NAME | EVENT DESCRIPTION |
|-----------------|------------|---|
| 0 | DSP_INT | Host-port interface (HPI)-to-DSP interrupt |
| 1 | TINT0 | Timer 0 interrupt |
| 2 | TINT1 | Timer 1 interrupt |
| 3 | SD_INT | EMIF SDRAM timer interrupt |
| 4 | EXT_INT4 | External interrupt pin 4 |
| 5 | EXT_INT5 | External interrupt pin 5 |
| 6 | EXT_INT6 | External interrupt pin 6 |
| 7 | EXT_INT7 | External interrupt pin 7 |
| 8 [†] | EDMA_TCC8 | EDMA transfer complete code (TCC) 1000b interrupt |
| 9 [†] | EDMA_TCC9 | EDMA TCC 1001b interrupt |
| 10 [†] | EDMA_TCC10 | EDMA TCC 1010b interrupt |
| 11 [†] | EDMA_TCC11 | EDMA TCC 1011b interrupt |
| 12 | XEVT0 | McBSP0 transmit event |
| 13 | REVT0 | McBSP0 receive event |
| 14 | XEVT1 | McBSP1 transmit event |
| 15 | REVT1 | McBSP1 receive event |

[†] EDMA channels 8 through 11 are used for transfer chaining only. For more detailed information on event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

interrupt sources and interrupt selector

The C62x DSP core supports 16 prioritized interrupts, which are listed in Table 16. The highest-priority interrupt is INT_00 (dedicated to RESET) while the lowest-priority interrupt is INT_15. The first four interrupts (INT_00–INT_03) are non-maskable and fixed. The remaining interrupts (INT_04–INT_15) are maskable and default to the interrupt source specified in Table 16. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

Table 16. C6211/C6211B DSP Interrupts

| CPU INTERRUPT NUMBER | INTERRUPT SELECTOR CONTROL REGISTER | SELECTOR VALUE (BINARY) | INTERRUPT EVENT | INTERRUPT SOURCE |
|----------------------|-------------------------------------|-------------------------|-----------------|--|
| INT_00 [†] | – | – | RESET | |
| INT_01 [†] | – | – | NMI | |
| INT_02 [†] | – | – | Reserved | Reserved. Do not use. |
| INT_03 [†] | – | – | Reserved | Reserved. Do not use. |
| INT_04 [‡] | MUXL[4:0] | 00100 | EXT_INT4 | External interrupt pin 4 |
| INT_05 [‡] | MUXL[9:5] | 00101 | EXT_INT5 | External interrupt pin 5 |
| INT_06 [‡] | MUXL[14:10] | 00110 | EXT_INT6 | External interrupt pin 6 |
| INT_07 [‡] | MUXL[20:16] | 00111 | EXT_INT7 | External interrupt pin 7 |
| INT_08 [‡] | MUXL[25:21] | 01000 | EDMA_INT | EDMA channel (0 through 15) interrupt |
| INT_09 [‡] | MUXL[30:26] | 01001 | Reserved | None, but programmable |
| INT_10 [‡] | MUXH[4:0] | 00011 | SD_INT | EMIF SDRAM timer interrupt |
| INT_11 [‡] | MUXH[9:5] | 01010 | Reserved | None, but programmable |
| INT_12 [‡] | MUXH[14:10] | 01011 | Reserved | None, but programmable |
| INT_13 [‡] | MUXH[20:16] | 00000 | DSP_INT | Host-port interface (HPI)-to-DSP interrupt |
| INT_14 [‡] | MUXH[25:21] | 00001 | TINT0 | Timer 0 interrupt |
| INT_15 [‡] | MUXH[30:26] | 00010 | TINT1 | Timer 1 interrupt |
| – | – | 01100 | XINT0 | McBSP0 transmit interrupt |
| – | – | 01101 | RINT0 | McBSP0 receive interrupt |
| – | – | 01110 | XINT1 | McBSP1 transmit interrupt |
| – | – | 01111 | RINT1 | McBSP1 receive interrupt |
| – | – | 10000 – 11111 | Reserved | Reserved. Do not use. |

[†] Interrupts INT_00 through INT_03 are non-maskable and fixed.

[‡] Interrupts INT_04 through INT_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 16 shows the default interrupt sources for Interrupts INT_04 through INT_15. For more detailed information on interrupt sources and selection, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

Terminal Functions

| SIGNAL NAME | NO. | TYPE† | IPD/ IPU‡ | DESCRIPTION |
|---------------------------|-----|-------|--------------|---|
| CLOCK/PLL | | | | |
| CLKIN | A3 | I | IPD | Clock Input |
| CLKOUT1 | D7 | O | IPD | Clock output at device speed The CLK1EN bit in the EMIF GBLCTL register controls the CLKOUT1 pin. CLK1EN = 0: CLKOUT1 is disabled CLK1EN = 1: CLKOUT1 enabled to clock [default] |
| CLKOUT2 | Y12 | O | IPD | Clock output at half of device speed When the CLKOUT2 pin is enabled, the CLK2EN bit in the EMIF global control register (GBLCTL) controls the CLKOUT2 pin. CLK2EN = 0: CLKOUT2 is disabled CLK2EN = 1: CLKOUT1 enabled to clock [default] |
| CLKMODE0 | C4 | I | IPU | Clock mode select • Selects whether the CPU clock frequency = input clock frequency x4 or x1 |
| PLLVS§ | A4 | A¶ | | PLL analog VCC connection for the low-pass filter |
| PLLG§ | C6 | A¶ | | PLL analog GND connection for the low-pass filter |
| PLLF | B5 | A¶ | | PLL low-pass filter connection to external components and a bypass capacitor |
| JTAG EMULATION | | | | |
| TMS | B7 | I | IPU | JTAG test-port mode select |
| TDO | A8 | O/Z | IPU | JTAG test-port data out |
| TDI | A7 | I | IPU | JTAG test-port data in |
| TCK | A6 | I | IPU | JTAG test-port clock |
| TRST | B6 | I | IPD | JTAG test-port reset |
| EMU5 | B12 | I/O/Z | IPU | Emulation pin 5. Reserved for future use, leave unconnected. |
| EMU4 | C11 | I/O/Z | IPU | Emulation pin 4. Reserved for future use, leave unconnected. |
| EMU3 | B10 | I/O/Z | IPU | Emulation pin 3. Reserved for future use, leave unconnected. |
| EMU2 | D10 | I/O/Z | IPU | Emulation pin 2. Reserved for future use, leave unconnected. |
| EMU1 | B9 | I/O/Z | IPU | Emulation pin 1 [#] |
| EMU0 | D9 | I/O/Z | IPU | Emulation pin 0 [#] |
| RESETS AND INTERRUPTS | | | | |
| RESET | A13 | I | IPU | Device reset |
| NMI | C13 | I | IPD | Nonmaskable interrupt • Edge-driven (rising edge) Any noise on the NMI pin may trigger an NMI interrupt; therefore, if the NMI pin is not used, it is recommended that the NMI pin be grounded versus relying on the IPD. |
| EXT_INT7 | E3 | I | IPU | External interrupts • Edge-driven • Polarity independently selected via the External Interrupt Polarity Register bits (EXTPOL.[3:0]) |
| EXT_INT6 | D2 | | | |
| EXT_INT5 | C1 | | | |
| EXT_INT4 | C2 | | | |
| HOST-PORT INTERFACE (HPI) | | | | |
| HINT | J20 | O | IPU | Host interrupt (from DSP to host) |
| HCNTL1 | G19 | I | IPU | Host control – selects between control, address, or data registers |
| HCNTL0 | G18 | I | IPU | Host control – selects between control, address, or data registers |
| HHWIL | H20 | I | IPU | Host half-word select – first or second half-word (not necessarily high or low order) |
| HR/W | G20 | I | IPU | Host read or write select |

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

§ PLLV and PLLG are not part of external voltage supply or ground. See the CLOCK/PLL documentation for information on how to connect these pins.

¶ A = Analog signal (PLL Filter)

The EMU0 and EMU1 pins are internally pulled up with 30-kΩ resistors; therefore, for emulation and normal operation, no external pullup/pulldown resistors are necessary. However, for boundary scan operation, pull down the EMU1 and EMU0 pins with a dedicated 1-kΩ resistor.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

development support

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

Software Development Tools:

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

Hardware Development Tools:

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)

EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL) and select “Find Development Tools”. For device-specific tools, under “Semiconductor Products”, select “Digital Signal Processors”, choose a product family, and select the particular DSP device. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Code Composer Studio, DSP/BIOS, and XDS are trademarks of Texas Instruments.

device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP devices and support tools. Each TMS320™ DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- TMX** Experimental device that is not necessarily representative of the final device's electrical specifications
- TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- TMS** Fully qualified production device

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped with appropriate disclaimers describing their limitations and intended uses. Experimental devices (TMX) may not be representative of a final product and Texas Instruments reserves the right to change or discontinue these products without notice.

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GFN), the temperature range (for example, blank is the default commercial temperature range), and the device speed range in megahertz (for example, -167 is 167 MHz).

Figure 4 provides a legend for reading the complete device name for any TMS3206000™ DSP family member.

documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

For device-specific datasheets and related documentation, visit the TI web site at: <http://www.ti.com>.

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ CPU (DSP core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the TMS320C62x™/TMS320C67x™ devices, associated development tools, and third-party support.

The *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646) describes the interrupt selector, interrupt selector registers, and the available interrupts in the TMS320C6000 DSPs.

The *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234) describes the operation of the enhanced direct memory access (EDMA) controller in the TMS320C6000 DSPs.

The *TMS320C62x/C67x Power Consumption Summary* application report (literature number SPRA486) discusses the power consumption for user applications with the TMS320C6211 and TMS320C6211B DSP devices.

The *TMS320C6211/TMS320C6211B Digital Signal Processors Silicon Errata* (literature number SPRZ154) describes the known exceptions to the functional specifications for the TMS320C6211 and TMS320C6211B DSP devices.

The *Using IBIS Models for Timing Analysis* application report (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

See the Worldwide Web URL for the application reports *How To Begin Development Today with the TMS320C6211 DSP* (literature number SPRA474) and *How To Begin Development with the TMS320C6711 DSP* (literature number SPRA522), which describe in more detail the similarities/differences between the C6211 and C6711 C6000™ DSP devices.

TMS320C6211, TMS320C6211B

FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

clock PLL

All of the internal C62x™ clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

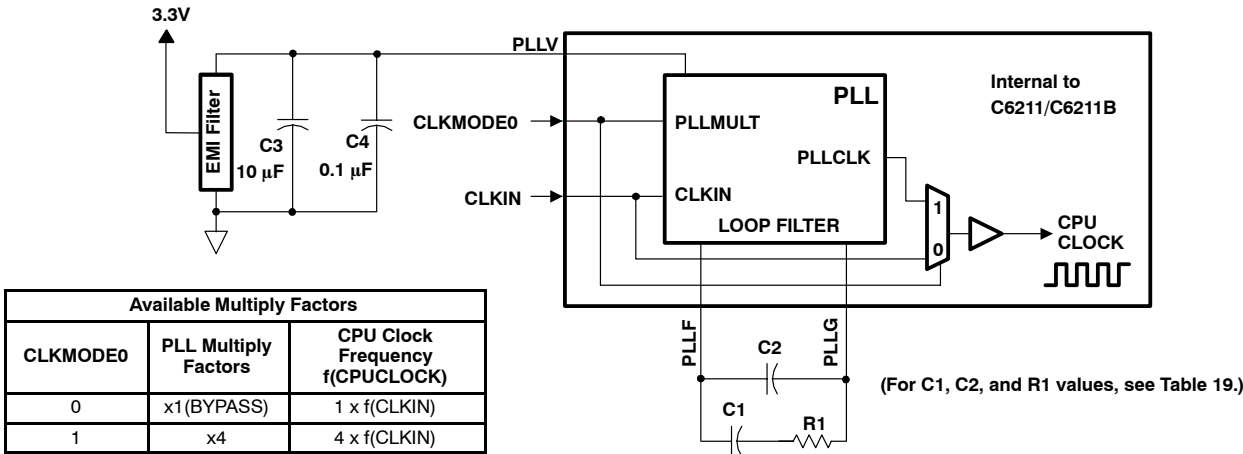

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Figure 5 shows the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Figure 6 shows the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the C62x™ device and the external clock oscillator circuit. Noise coupling into PLLF will directly impact PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the DSP requirements in this data sheet (see the *electrical characteristics over recommended ranges of supply voltage and operating case temperature* table and the *input and output clocks* electricals section). Table 18 lists some examples of compatible CLKIN external clock sources.

Table 18. Compatible CLKIN External Clock Sources

| COMPATIBLE PARTS FOR EXTERNAL CLOCK SOURCES (CLKIN) | PART NUMBER | MANUFACTURER |
|---|---------------------------|----------------------------|
| Oscillators | JITO-2 | Fox Electronix |
| | STA series, ST4100 series | SaRonix Corporation |
| | SG-636 | Epson America |
| | 342 | Corning Frequency Control |
| PLL | MK1711-S, ICS525-02 | Integrated Circuit Systems |

- NOTES: A. Keep the lead length and the number of vias between the PLLF pin, the PLLG pin, and R1, C1, and C2 to a minimum. In addition, place all PLL external components (R1, C1, C2, C3, C4, and the EMI Filter) as close to the C6000 device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.
- B. For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI filter).
- C. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.
- D. EMI filter manufacturer: TDK part number ACF451832-333, 223, 153, 103. Panasonic part number EXCET103U.

Figure 5. External PLL Circuitry for Either PLL x4 Mode or x1 (Bypass) Mode

clock PLL (continued)

- NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF terminal to the PLLG terminal.
B. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.

Figure 6. External PLL Circuitry for x1 (Bypass) Mode Only

Table 19. C6211/C6211B PLL Component Selection

| CLKMODE | CLKIN RANGE (MHz) | CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz) | CLKOUT2 RANGE (MHz) | R1 [$\pm 1\%$] (Ω) | C1 [$\pm 10\%$] (nF) | C2 [$\pm 10\%$] (pF) | TYPICAL LOCK TIME (μ s) [†] |
|---------|-------------------|---|---------------------|-------------------------------|------------------------|------------------------|---|
| x4 | 16.3–41.6 | 65–167 | 32.5–83 | 60.4 | 27 | 560 | 75 |

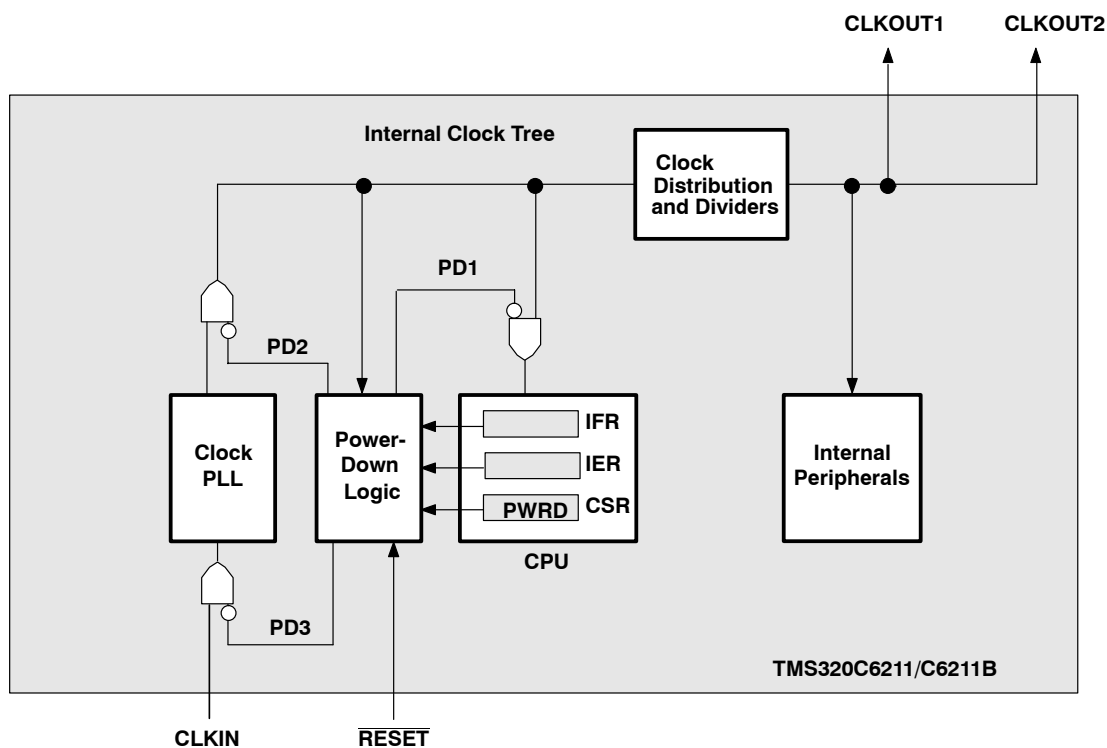

[†] Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μ s, the maximum value may be as long as 250 μ s.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

power-down mode logic

Figure 7 shows the power-down mode logic on the C6211/C6211B.

† External input clocks, with the exception of CLKIN, are *not* gated by the power-down mode logic.

Figure 7. Power-Down Mode Logic†

triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 8 and described in Table 20. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when “writing” to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Legend: R/W-x = Read/write reset value

NOTE: The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

Figure 8. PWRD Field of the CSR Register

A delay of up to nine clock cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled interrupt, the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 20 summarizes all the power-down modes.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

Table 20. Characteristics of the Power-Down Modes

| PRWD FIELD (BITS 15–10) | POWER-DOWN MODE | WAKE-UP METHOD | EFFECT ON CHIP'S OPERATION |
|----------------------------|--------------------|---|--|
| 000000 | No power-down | — | — |
| 001001 | PD1 | Wake by an enabled interrupt | CPU halted (except for the interrupt logic) Power-down mode blocks the internal clock inputs at the boundary of the CPU, preventing most of the CPU's logic from switching. During PD1, EDMA transactions can proceed between peripherals and internal memory. |
| 010001 | PD1 | Wake by an enabled or non-enabled interrupt | |
| 011010 | PD2 [†] | Wake by a device reset | Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. |
| 011100 | PD3 [†] | Wake by a device reset | Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up. |
| All others | Reserved | — | — |

[†] When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

power-supply design considerations

For systems using the C6000™ DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, as many as five external clock cycle pulses may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the *Using the TPS56300 to Power DSPs* application report (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

IEEE 1149.1 JTAG compatibility statement

The TMS320C6211/C6211B DSP requires that both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ resets be asserted upon power up to be properly initialized. While $\overline{\text{RESET}}$ initializes the DSP core, $\overline{\text{TRST}}$ initializes the DSP's emulation logic. Both resets are required for proper operation.

While both $\overline{\text{TRST}}$ and $\overline{\text{RESET}}$ need to be asserted upon power up, only $\overline{\text{RESET}}$ needs to be released for the DSP to boot properly. $\overline{\text{TRST}}$ may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state.

$\overline{\text{TRST}}$ only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality.

For maximum reliability, the TMS320C6211/C6211B DSP includes an internal pulldown (IPD) on the $\overline{\text{TRST}}$ pin to ensure that $\overline{\text{TRST}}$ will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive $\overline{\text{TRST}}$ high. However, some third-party JTAG controllers may not drive $\overline{\text{TRST}}$ high but expect the use of an external pullup resistor on $\overline{\text{TRST}}$.

When using this type of JTAG controller, assert $\overline{\text{TRST}}$ to initialize the DSP after powerup and externally drive $\overline{\text{TRST}}$ high before attempting any emulation or boundary scan operations. Following the release of $\overline{\text{RESET}}$, the low-to-high transition of $\overline{\text{TRST}}$ must be "seen" to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

EMIF device speed

TI recommends utilizing the input/output buffer information specification (IBIS) models to analyze all AC timings. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

bootmode

The C62x™ device resets using the active-low signal $\overline{\text{RESET}}$ signal (for the C6211/C6211B device, the $\overline{\text{RESET}}$ signal is the same as the internal reset signal). While $\overline{\text{RESET}}$ is low, the internal reset is also asserted and the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of the internal reset signal (see the Reset Phase 3 discussion in the Reset Timing section of this data sheet) starts the processor running with the prescribed device configuration and boot mode.

The C6211/C6211B has three types of boot modes:

- **Host boot**

If host boot is selected, upon release of internal reset, the CPU is internally “stalled” while the remainder of the device is released. During this period, an external host can initialize the CPU’s memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the “stalled” state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally “stalled”. Also, DSPINT brings the CPU out of the “stalled” state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the “stalled” state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

- **Emulation boot**

Emulation boot mode is a variation of host boot. In this mode, it is not necessary for a host to load code or to set DSPINT to release the CPU from the “stalled” state. Instead, the emulator will set DSPINT if it has not been previously set so that the CPU can begin executing code from address 0. Prior to beginning execution, the emulator sets a breakpoint at address 0. This prevents the execution of invalid code by halting the CPU prior to executing the first instruction. Emulation boot is a good tool in the debug phase of development.

- **EMIF boot (using default ROM timings)**

Upon the release of internal reset, the 1K-Byte ROM code located in the beginning of $\overline{\text{CE1}}$ is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. The boot process also lets you choose the width of the ROM. In this case, the EMIF automatically assembles consecutive 8-bit bytes or 16-bit half-words to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and start running from address 0.

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. If needed, external logic hardware such as buffers may be used to compensate any timing differences. For example:

- In typical boards with the C6211B commercial temperature device, the routing delay improves the external memory's ability to meet the DSP's EMIF data input hold time requirement [$t_{h(EKOH-EDV)}$].
- In some boards with the C6211BGFNA extended temperature device, the routing delay improves the external memory's ability to meet the DSP's EMIF data input hold time requirement [$t_{h(EKOH-EDV)}$]. In addition, it may be necessary to add an extra delay to the input clock of the external memory to robustly meet the DSP's data input hold time requirement. If the extra delay approach is used, memory bus frequency adjustments may be needed to ensure the DSP's input setup time requirement [$t_{su(EDV-EKOH)}$] is still maintained.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 21 and Figure 12).

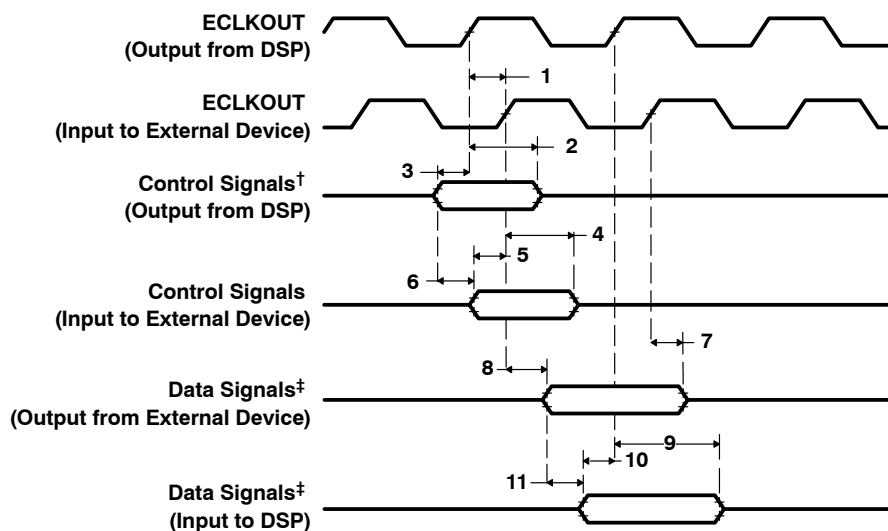

Figure 12 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

PARAMETER MEASUREMENT INFORMATION (CONTINUED)

Table 21. IBIS Timing Parameters Example (see Figure 12)

| NO. | DESCRIPTION |
|-----|--|
| 1 | Clock route delay |
| 2 | Minimum DSP hold time |
| 3 | Minimum DSP setup time |
| 4 | External device hold time requirement |
| 5 | External device setup time requirement |
| 6 | Control signal route delay |
| 7 | External device hold time |
| 8 | External device access time |
| 9 | DSP hold time requirement |
| 10 | DSP setup time requirement |
| 11 | Data route delay |

† Control signals include data for Writes.

‡ Data signals are generated during Reads from an external device.

Figure 12. IBIS Input/Output Timings

INPUT AND OUTPUT CLOCKS

timing requirements for CLKIN^{†‡} (see Figure 13)

| NO. | | | -150 | | | | -167 | | | | UNIT |
|-----|-------------------------|----------------------------|--------------|-----|--------------|-----|--------------|-----|--------------|-----|------|
| | | | CLKMODE = x4 | | CLKMODE = x1 | | CLKMODE = x4 | | CLKMODE = x1 | | |
| | | | MIN | MAX | MIN | MAX | MIN | MAX | MIN | MAX | |
| 1 | t _c (CLKIN) | Cycle time, CLKIN | 26.7 | | 6.7 | | 24 | | 6 | | ns |
| 2 | t _w (CLKINH) | Pulse duration, CLKIN high | 0.4C | | 0.45C | | 0.4C | | 0.45C | | ns |
| 3 | t _w (CLKINL) | Pulse duration, CLKIN low | 0.4C | | 0.45C | | 0.4C | | 0.45C | | ns |
| 4 | t _t (CLKIN) | Transition time, CLKIN | | 5 | | 1 | | 5 | | 1 | ns |

[†] The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.

[‡] C = CLKIN cycle time in ns. For example, when CLKIN frequency is 40 MHz, use C = 25 ns.

Figure 13. CLKIN Timings

INPUT AND OUTPUT CLOCKS (CONTINUED)

switching characteristics over recommended operating conditions for CLKOUT1^{†‡§}
(see Figure 14)

| NO. | PARAMETER | | -150 -167 | | | | UNIT |
|-----|------------------------|------------------------------|--------------|-------------|--------------|----------|------|
| | | | CLKMODE = x4 | | CLKMODE = x1 | | |
| | | | MIN | MAX | MIN | MAX | |
| 1 | t _c (CKO1) | Cycle time, CLKOUT1 | P – 0.7 | P + 0.7 | P – 0.7 | P + 0.7 | ns |
| 2 | t _w (CKO1H) | Pulse duration, CLKOUT1 high | (P/2) – 0.7 | (P/2) + 0.7 | PH – 0.7 | PH + 0.7 | ns |
| 3 | t _w (CKO1L) | Pulse duration, CLKOUT1 low | (P/2) – 0.7 | (P/2) + 0.7 | PL – 0.7 | PL + 0.7 | ns |
| 4 | t _t (CKO1) | Transition time, CLKOUT1 | 2 | | 2 | | ns |

[†] The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.

[‡] $P = 1/\text{CPU clock frequency}$ in nanoseconds (ns)

[§] PH is the high period of CLKIN in ns and PL is the low period of CLKIN in ns.

Figure 14. CLKOUT1 Timings

switching characteristics over recommended operating conditions for CLKOUT2^{†‡} (see Figure 15)

| NO. | PARAMETER | -150 -167 | | UNIT |
|-----|---|--------------|------------|------|
| | | MIN | MAX | |
| 1 | $t_{c(CKO2)}$ Cycle time, CLKOUT2 | $2P - 0.7$ | $2P + 0.7$ | ns |
| 2 | $t_{w(CKO2H)}$ Pulse duration, CLKOUT2 high | $P - 0.7$ | $P + 0.7$ | ns |
| 3 | $t_{w(CKO2L)}$ Pulse duration, CLKOUT2 low | $P - 0.7$ | $P + 0.7$ | ns |
| 4 | $t_{t(CKO2)}$ Transition time, CLKOUT2 | 2 | | ns |

[†] The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.

[‡] $P = 1/\text{CPU clock frequency}$ in ns

Figure 15. CLKOUT2 Timings

TMS320C6211, TMS320C6211B FIXED-POINT DIGITAL SIGNAL PROCESSORS

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

INPUT AND OUTPUT CLOCKS (CONTINUED)

timing requirements for ECLKIN[†] (see Figure 16)

| NO. | | -150 -167 | | UNIT |
|-----|---|--------------|-----|------|
| | | MIN | MAX | |
| 1 | $t_{c(EKI)}$ Cycle time, ECLKIN | 10 | | ns |
| 2 | $t_{w(EKIH)}$ Pulse duration, ECLKIN high | 4.5 | | ns |
| 3 | $t_{w(EKIL)}$ Pulse duration, ECLKIN low | 4.5 | | ns |
| 4 | $t_t(EKI)$ Transition time, ECLKIN | | 2.2 | ns |

[†] The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.

Figure 16. ECLKIN Timings

switching characteristics over recommended operating conditions for ECLKOUT^{‡§¶} (see Figure 17)

| NO. | PARAMETER | -150 -167 | | UNIT |
|-----|--|--------------|------------|------|
| | | MIN | MAX | |
| 1 | $t_{c(EKO)}$ Cycle time, ECLKOUT | $E - 0.7$ | $E + 0.7$ | ns |
| 2 | $t_{w(EKOH)}$ Pulse duration, ECLKOUT high | $EH - 0.7$ | $EH + 0.7$ | ns |
| 3 | $t_{w(EKOL)}$ Pulse duration, ECLKOUT low | $EL - 0.7$ | $EL + 0.7$ | ns |
| 4 | $t_t(EKO)$ Transition time, ECLKOUT | | 2 | ns |
| 5 | $t_d(EKIH-EKOH)$ Delay time, ECLKIN high to ECLKOUT high | 1 | 7 | ns |
| 6 | $t_d(EKIL-EKOL)$ Delay time, ECLKIN low to ECLKOUT low | 1 | 7 | ns |

[‡] The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.

[§] E = ECLKIN period in ns

[¶] EH is the high period of ECLKIN in ns and EL is the low period of ECLKIN in ns.

Figure 17. ECLKOUT Timings

ASYNCHRONOUS MEMORY TIMING

timing requirements for asynchronous memory cycles^{†‡§} (see Figure 18–Figure 19)

| NO. | | C6211–150 C6211–167 | | C6211B–150 C6211B–167 C6211BGFNA–150 | | UNIT |
|-----|---|------------------------|-----|--|-----|------|
| | | MIN | MAX | MIN | MAX | |
| 3 | $t_{su}(EDV-AREH)$ Setup time, EDx valid before \overline{ARE} high | 9 | | 9 | | ns |
| 4 | $t_h(AREH-EDV)$ Hold time, EDx valid after \overline{ARE} high | 1 | | 2 | | ns |
| 6 | $t_{su}(ARDY-EKOH)$ Setup time, ARDY valid before ECLKOUT high | 3 | | 3 | | ns |
| 7 | $t_h(EKOH-ARDY)$ Hold time, ARDY valid after ECLKOUT high | 1 | | 2 | | ns |

[†] To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. The ARDY signal is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of the ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.

[‡] RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

SPRS073K – AUGUST 1998 – REVISED MARCH 2004

HOLD/HOLDA TIMING

timing requirements for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles[†] (see Figure 29)

| NO. | | -150 -167 | UNIT |
|-----|---|--------------|------|
| | | MIN MAX | |
| 3 | $t_{oh}(\overline{\text{HOLDAL}}-\overline{\text{HOLDL}})$ Output hold time, $\overline{\text{HOLD}}$ low after $\overline{\text{HOLDA}}$ low | E | ns |

[†] E = ECLKIN period in ns

switching characteristics over recommended operating conditions for the $\overline{\text{HOLD}}/\overline{\text{HOLDA}}$ cycles^{†‡} (see Figure 29)

| NO. | PARAMETER | -150 -167 | UNIT |
|-----|--|--------------|------|
| | | MIN MAX | |
| 1 | $t_d(\overline{\text{HOLDL}}-\text{EMHZ})$ Delay time, $\overline{\text{HOLD}}$ low to EMIF Bus high impedance | 2E § | ns |
| 2 | $t_d(\text{EMHZ}-\overline{\text{HOLDAL}})$ Delay time, EMIF Bus high impedance to $\overline{\text{HOLDA}}$ low | 0 2E | ns |
| 4 | $t_d(\overline{\text{HOLDH}}-\text{EMLZ})$ Delay time, $\overline{\text{HOLD}}$ high to EMIF Bus low impedance | 2E 7E | ns |
| 5 | $t_d(\text{EMLZ}-\overline{\text{HOLDAH}})$ Delay time, EMIF Bus low impedance to $\overline{\text{HOLDA}}$ high | 0 2E | ns |

[†] E = ECLKIN period in ns

[‡] EMIF Bus consists of $\overline{\text{CE}}[3:0]$, $\overline{\text{BE}}[3:0]$, $\overline{\text{ED}}[31:0]$, $\overline{\text{EA}}[21:2]$, $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, and $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SSWE}}$.

[§] All pending EMIF transactions are allowed to complete before $\overline{\text{HOLDA}}$ is asserted. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting $\text{NOHOLD} = 1$.

[†] EMIF Bus consists of $\overline{\text{CE}}[3:0]$, $\overline{\text{BE}}[3:0]$, $\overline{\text{ED}}[31:0]$, $\overline{\text{EA}}[21:2]$, $\overline{\text{ARE}}/\overline{\text{SDCAS}}/\overline{\text{SSADS}}$, $\overline{\text{AOE}}/\overline{\text{SDRAS}}/\overline{\text{SSOE}}$, and $\overline{\text{AWE}}/\overline{\text{SDWE}}/\overline{\text{SSWE}}$.

RESET TIMING

timing requirements for reset[†] (see Figure 31)

| NO. | | | -150 -167 | UNIT |
|-----|--------------|---|--------------|------|
| | | | MIN MAX | |
| 1 | $t_{w(RST)}$ | Width of the RESET pulse (PLL stable) [‡] | 10P | ns |
| | | Width of the RESET pulse (PLL needs to sync up) [§] | 250 | μs |
| 14 | $t_{su(HD)}$ | Setup time, HD boot configuration bits valid before RESET high [¶] | 2P | ns |
| 15 | $t_h(HD)$ | Hold time, HD boot configuration bits valid after RESET high [¶] | 2P | ns |

[†] P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

[‡] This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4 when CLKIN and PLL are stable.

[§] This parameter applies to CLKMODE x4 only (it does not apply to CLKMODE x1). The RESET signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, RESET must be asserted to ensure proper device operation. See the *clock PLL* section for PLL lock times.

[¶] HD[4:3] are the boot configuration pins during device reset.

switching characteristics over recommended operating conditions during reset^{†#||} (see Figure 31)

|-----|---|---|------------------------|-----|------|
| | | | MIN | MAX | |
| 5 | $t_d(\overline{HCS}-\overline{HRDY})$ | Delay time, \overline{HCS} to \overline{HRDY} [¶] | 1 | 15 | ns |
| 6 | $t_d(\overline{HSTBL}-\overline{HRDYH})$ | Delay time, $\overline{HSTROBE}$ low to \overline{HRDY} high [#] | 3 | 15 | ns |
| 7 | $t_d(\overline{HSTBL}-\overline{HDLZ})$ | Delay time, $\overline{HSTROBE}$ low to HD low impedance for an HPI read | 2 | | ns |
| 8 | $t_d(\overline{HDV}-\overline{HRDYH})$ | Delay time, HD valid to \overline{HRDY} low | 2P – 4 | 2P | ns |
| 9 | $t_{oh}(\overline{HSTBH}-\overline{HDV})$ | Output hold time, HD valid after $\overline{HSTROBE}$ high | 3 | 15 | ns |
| 15 | $t_d(\overline{HSTBH}-\overline{HDHZ})$ | Delay time, $\overline{HSTROBE}$ high to HD high impedance | 3 | 15 | ns |
| 16 | $t_d(\overline{HSTBL}-\overline{HDV})$ | Delay time, $\overline{HSTROBE}$ low to HD valid | 3 | 15 | ns |
| 17 | $t_d(\overline{HSTBH}-\overline{HRDYH})$ | Delay time, $\overline{HSTROBE}$ high to \overline{HRDY} high | 3 | 15 | ns |
| 20 | $t_d(\overline{HASL}-\overline{HRDYH})$ | Delay time, \overline{HAS} low to \overline{HRDY} high | 3 | 15 | ns |

[†] $\overline{HSTROBE}$ refers to the following logical operation on \overline{HCS} , $\overline{HDS1}$, and $\overline{HDS2}$: $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$.

[‡] P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

[¶] \overline{HCS} enables \overline{HRDY} , and \overline{HRDY} is always low when \overline{HCS} is high. The case where \overline{HRDY} goes high when \overline{HCS} falls indicates that HPI is busy completing a previous HPID write or READ with autoincrement.

[#] This parameter is used during an HPID read. At the beginning of the first half-word transfer on the falling edge of $\overline{HSTROBE}$, the HPI sends the request to the EDMA internal address generation hardware, and \overline{HRDY} remains high until the EDMA internal address generation hardware loads the requested data into HPID.

^{||} This parameter is used after the second half-word of an HPID write or autoincrement read. \overline{HRDY} remains low if the access is not an HPID write or autoincrement read. Reading or writing to HPIC or HPIA does not affect the \overline{HRDY} signal.

MULTICHANNEL BUFFERED SERIAL PORT TIMING

timing requirements for McBSP^{†‡} (see Figure 37)

| NO. | | | | -150 -167 | | UNIT |
|-----|---------------------------|---|------------|---------------------------|-----|------|
| | | | | MIN | MAX | |
| 2 | $t_c(\text{CKRX})$ | Cycle time, CLKR/X | CLKR/X ext | 2P [§] | | ns |
| 3 | $t_w(\text{CKRX})$ | Pulse duration, CLKR/X high or CLKR/X low | CLKR/X ext | $0.5t_c(\text{CKRX}) - 1$ | | ns |
| 5 | $t_{su}(\text{FRH-CKRL})$ | Setup time, external FSR high before CLKR low | CLKR int | 20 | | ns |
| | | | CLKR ext | 1 | | |
| 6 | $t_h(\text{CKRL-FRH})$ | Hold time, external FSR high after CLKR low | CLKR int | 6 | | ns |
| | | | CLKR ext | 3 | | |
| 7 | $t_{su}(\text{DRV-CKRL})$ | Setup time, DR valid before CLKR low | CLKR int | 22 | | ns |
| | | | CLKR ext | 3 | | |
| 8 | $t_h(\text{CKRL-DRV})$ | Hold time, DR valid after CLKR low | CLKR int | 3 | | ns |
| | | | CLKR ext | 4 | | |
| 10 | $t_{su}(\text{FXH-CKXL})$ | Setup time, external FSX high before CLKX low | CLKX int | 23 | | ns |
| | | | CLKX ext | 1 | | |
| 11 | $t_h(\text{CKXL-FXH})$ | Hold time, external FSX high after CLKX low | CLKX int | 6 | | ns |
| | | | CLKX ext | 3 | | |

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

[‡] P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

[§] The minimum CLKR/X period is twice the CPU cycle time (2P). This means that the maximum bit rate for communications between the McBSP and other device is 83 Mbps for 167 MHz CPU clock or 75 Mbps for 150 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 167 MHz (P = 6 ns), use 30 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

[†] CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

[‡] Minimum delay times also represent minimum output hold times.

[§] P = 1/CPU clock frequency in ns. For example, when running parts at 167 MHz, use P = 6 ns.

[¶] The minimum CLKR/X period is twice the CPU cycle time (2P). This means that the maximum bit rate for communications between the McBSP and other device is 83 Mbps for 167 MHz CPU clock or 75 Mbps for 150 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 167 MHz (P = 6 ns), use 30 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

[#] C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P_clks if CLKSM = 0 (P_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) * S if CLKGDV is even

= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) * S if CLKGDV is even

= (CLKGDV + 1)/2 * S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see [¶] footnote above).

^{||} Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

If DXENA = 0, then D1 = D2 = 0

If DXENA = 1, then D1 = 2P, D2 = 4P

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - May not be currently available - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

None: Not yet available Lead (Pb-Free).

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Green (RoHS & no Sb/Br): TI defines "Green" to mean "Pb-Free" and in addition, uses package materials that do not contain halogens, including bromine (Br) or antimony (Sb) above 0.1% of total product weight.

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

О компании

ООО "ТрейдЭлектроникс" - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Наличие собственной эффективной системы логистики обеспечивает надежную поставку продукции по конкурентным ценам в точно указанные сроки.

Срок поставки со стоков в **Европе и Америке – от 3 до 14 дней.**

Срок поставки из **Азии – от 10 дней.**

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Предоставляем спец цены на элементы для создания инженерных сэмплов.

Упорный труд, качественный результат дают нам право быть уверенными в себе и надежными для наших клиентов.

Наша компания это:

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование

Наша организация особенно сильна в поставках модулей, микросхем, пассивных компонентов, ксайленсах (XC), EPF, EPM и силовой электроники.

Большой выбор предлагаемой продукции, различные виды оплаты и доставки, позволят Вам сэкономить время и получить максимум выгоды от сотрудничества с нами!

Перечень производителей, продукцию которых мы поставляем на российский рынок

Trade Electronics.ru

гарантия бесперебойности производства и
качества выпускаемой продукции

С удовольствием будем прорабатывать для Вас поставки всех необходимых компонентов по текущим запросам для скорейшего выявления групп элементов, по которым сотрудничество именно с нашей компанией будет для Вас максимально выгодным!

С уважением,

Менеджер отдела продаж ООО

«Трейд Электроникс»

Шишлаков Евгений
