General Description

The HT1117 devices are a series of three-terminal high current low voltage regulators. They can deliver an output current of 1A and can accept input voltages up to 12V. The devices are available in both adjustable and

fixed output voltage type with a range of 1.8V to 5.0V. Internal current limit and thermal protection circuits provide protection against overload conditions that could create excessive junction temperatures.

Absolute Maximum Ratings*

Input Supply Voltage $V_{SS}-0.3V$ to $V_{SS}+13V$ Storage Temperature $-50^{\circ}C$ to $125^{\circ}C$

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

"**" Absolute maximum ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. The guaranteed specifications apply only for the test conditions listed.

Recommended Operating Conditions

- Note:
- Specifications are production tested at room temperature, T_a . Specifications within the -40°C to 85°C operating temperature range are assured by design, characterization and correlation with Statistical Quality Controls (SQC).
 - Load regulation is measured at a constant junction temperature, using pulse testing with a low ON time and is guaranteed up to the maximum power dissipation. Power dissipation is determined by the input/output differential voltage and the output current. Guaranteed maximum power dissipation will not be available over the full input/output range. The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_a) / \theta_{JA}$.
 - Dropout voltage is defined as the input voltage minus the output voltage that produces a 2% change in the output voltage from the value at $V_{IN} = V_{OUT} + 1.5\text{V}$ with a fixed load.
 - Current limit is measured by pulsing for a short time.

Application Circuits

Basic Circuits

- Variable voltage type

$$V_{OUT} = V_{REF} \left(1 + \frac{R2}{R1} \right) + I_{ADJ} R2$$

Note: C1 is required if the needed if the device is located far from filter capacitors, the recommended value is 10µF.
C2 is required for stability, the recommended value is 10µF.
R1 is required for regulation, the recommended value is 125Ω.

- Fixed voltage type

Note: C1 is required if the needed if the device is located far from filter capacitors, the recommended value is 10µF.
C2 is required for stability, the recommended value is 10µF.

Typical Application Circuits

- 1.25V~10.5V regulator

- Digitally selected outputs

- High output current positive voltage regulator

$$R_1 = \frac{V_{BE1}}{I_{REG} - \frac{I_{C1}}{(1+\beta)}},$$

$$I_o = I_{C1} + I_{REG}$$

- Increased Output voltage Circuit

• Dual Supply Circuit
