Description

Atmel's new family of high speed CMOS transceivers offers the best of all worlds to the user requiring stability and ultra fast speeds. These transceivers, which can function as two 8-bit devices or one 16-bit device, are capable of improving processing efficiency as much as 6% by reducing the number of wait states required during memory access. In addition, this family of parts has been designed to minimize ground bounce on the outputs while rejecting input spikes of up to 1.8V and 1 ns wide. This combination of ultra high speed and low noise is the next step in high speed performance.

Test Circuits^(1,2)

Note: 1. Pulse Generator: Rate $\leq 1.0\text{ MHz}$, $t_F \leq 2.5\text{ ns}$, $t_R \leq 2.5\text{ ns}$.

2. AC tests are done with a single bit switching, and timings need to be derated when multiple outputs are switching in the same direction simultaneously. This derating should not exceed 0.5 ns for 16 inputs switching simultaneously.

Switch Position

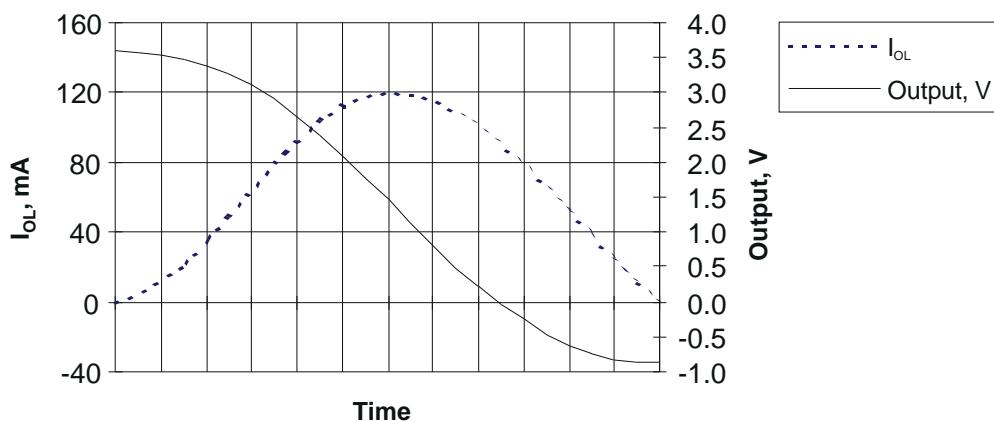

Test	Switch
Open Drain Disable Low Enable Low	Closed
All Other Tests	Open

Definitions:

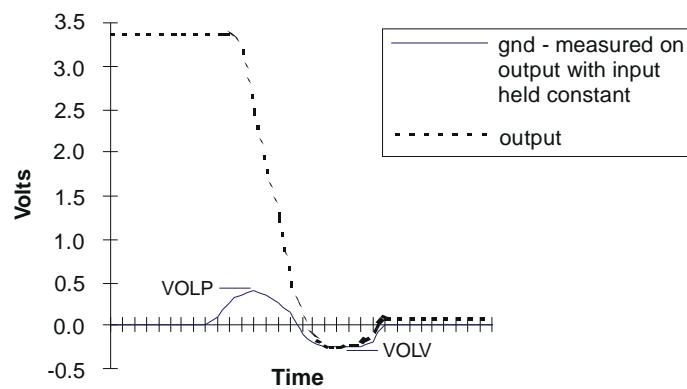

C_L = Load capacitance; Includes jig and probe capacitance.

R_T = Termination resistance; Should be equal to Z_{OUT} of the Pulse Generator.

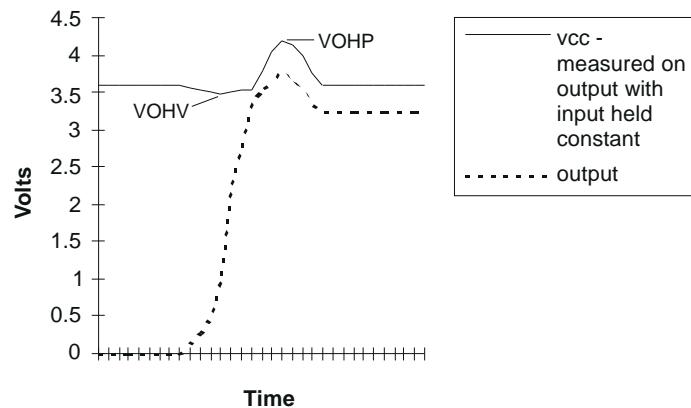

IOL Pull Down Current

Ground Bounce for High to Low Transitions⁽¹⁾

Supply Bounce for Low to High Transitions⁽²⁾

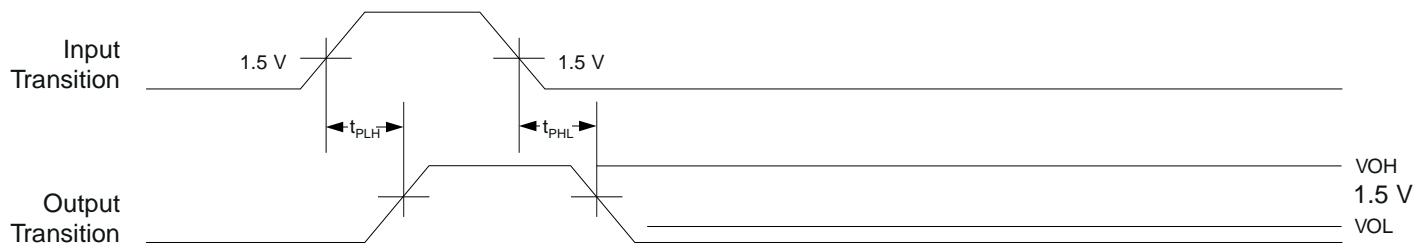

Typical Values

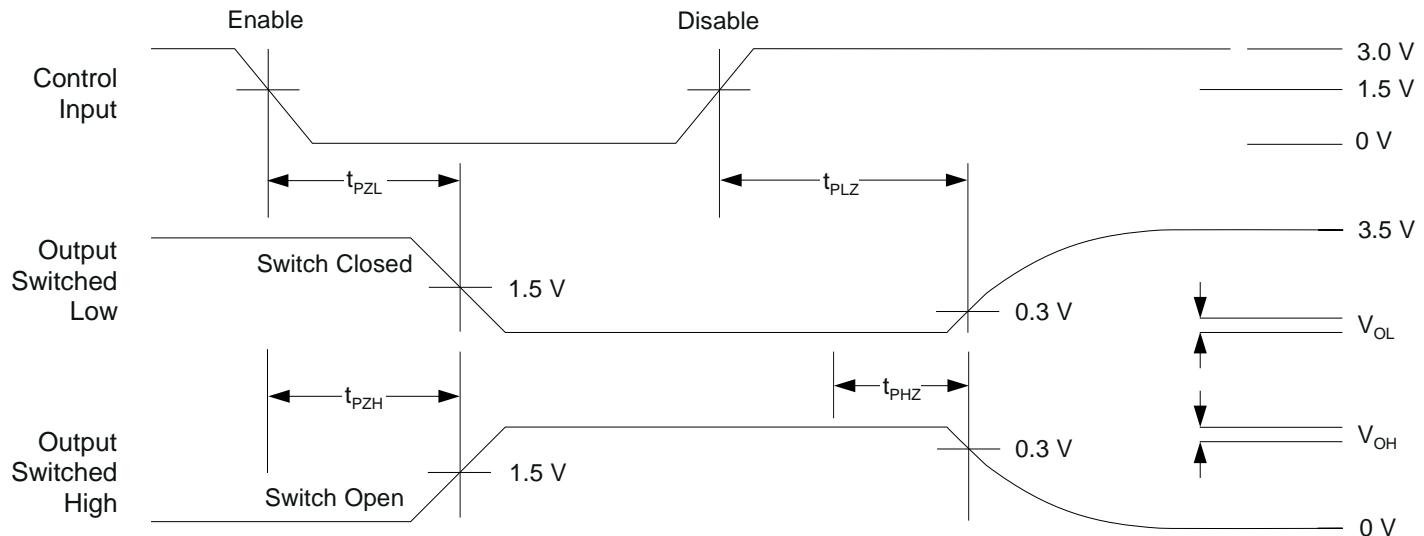

Parameter	Value	Units
V_{OLP}	0.4	V
V_{OLV}	-0.26	V
V_{OHV}	$V_{CC} - 0.13$	V
V_{OHP}	$V_{CC} + 0.6$	V

- Note:
1. When multiple outputs are switched at the same time, rapidly changing current on the ground and V_{CC} paths cause a voltage to develop across the parasitic inductance of the wire bond and package pins. This occurrence is called simultaneous switching noise. Atmel's AT16245 products have minimized this phenomenon as shown on the graph. Output data is for 15 outputs switching simultaneously at a frequency of 1 MHz. The ground data is measured on the one remaining output, which is set to logic low and will reflect any device ground movement.
 2. As on the graph for Ground Bounce, a similar condition occurs for low to high transitions. Output data is for 15 outputs switching simultaneously at a frequency of 1 MHz. V_{CC} droop is measured on the one remaining output pin, which is set to a logic high. This output will reflect any movement on the device V_{CC} .
