

## SimtekSoftStore 2K x 8 nvSRAM

### Features

- High-performance CMOS nonvolatile static RAM 2048 x 8 bits
- 25, 35 and 45 ns Access Times
- 12, 20 and 25 ns Output Enable Access Times
- Software STORE Initiation (STORE Cycle Time < 10 ms)
- Automatic STORE Timing
- 10<sup>6</sup> STORE cycles to EEPROM
- 100 years data retention in EEPROM
- Automatic RECALL on Power Up
- Software RECALL Initiation (RECALL Cycle Time < 20  $\mu$ s)
- Unlimited RECALL cycles from EEPROM
- Unlimited Read and Write to SRAM
- Single 5 V  $\pm$  10 % Operation
- Operating temperature ranges:  
0 to 70  $^{\circ}$ C  
-40 to 85  $^{\circ}$ C
- QS 9000 Quality Standard
- ESD protection > 2000 V (MIL STD 883C M3015.7-HBM)
- RoHS compliance and Pb- free
- Packages: PDIP28 (600 mil)  
SOP24 (300 mil)

### Description

The U631H16 has two separate modes of operation: SRAM mode and nonvolatile mode. In SRAM mode, the memory operates as an ordinary static RAM. In nonvolatile operation, data is transferred in parallel from SRAM to EEPROM or from EEPROM to SRAM. In this mode SRAM functions are disabled.

The U631H16 is a fast static RAM (25, 35, 45 ns), with a nonvolatile electrically erasable PROM (EEPROM) element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent nonvolatile data resides in EEPROM.

Data transfers from the SRAM to the EEPROM (the STORE operation), or from the EEPROM to the SRAM (the RECALL ) operation) are initiated through software sequences.

The U631H16 combines the high performance and ease of use of a fast SRAM with nonvolatile data

integrity.

Once a STORE cycle is initiated, further input or output are disabled until the cycle is completed.

Because a sequence of addresses is used for STORE initiation, it is important that no other read or write accesses intervene in the sequence or the sequence will be aborted.

Internally, RECALL is a two step procedure. First, the SRAM data is cleared and second, the nonvolatile information is transferred into the SRAM cells.

The RECALL operation in no way alters the data in the EEPROM cells. The nonvolatile data can be recalled an unlimited number of times.

### Pin Configuration

### Pin Description

| Signal Name | Signal Description   |
|-------------|----------------------|
| A0 - A10    | Address Inputs       |
| DQ0 - DQ7   | Data In/Out          |
| $\bar{E}$   | Chip Enable          |
| $\bar{G}$   | Output Enable        |
| $\bar{W}$   | Write Enable         |
| VCC         | Power Supply Voltage |
| VSS         | Ground               |

Block Diagram

Truth Table for SRAM Operations

| Operating Mode       | $\overline{E}$ | $\overline{W}$ | $\overline{G}$ | DQ0 - DQ7          |

\* H or L

Characteristics

All voltages are referenced to  $V_{SS} = 0\text{ V}$  (ground).

All characteristics are valid in the power supply voltage range and in the operating temperature range specified.

Dynamic measurements are based on a rise and fall time of  $\leq 5\text{ ns}$ , measured between 10 % and 90 % of  $V_I$ , as well as input levels of  $V_{IL} = 0\text{ V}$  and  $V_{IH} = 3\text{ V}$ . The timing reference level of all input and output signals is 1.5 V, with the exception of the  $t_{dis}$ -times and  $t_{en}$ -times, in which cases transition is measured  $\pm 200\text{ mV}$  from steady-state voltage.

a: Stresses greater than those listed under „Absolute Maximum Ratings“ may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

- b:  $I_{CC1}$  and  $I_{CC3}$  are dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded. The current  $I_{CC1}$  is measured for WRITE/READ - ratio of 1/2.
- c:  $I_{CC2}$  is the average current required for the duration of the STORE cycle (STORE Cycle Time).
- d: Bringing  $\overline{E} \geq V_{IH}$  will not produce standby current levels until any nonvolatile cycle in progress has timed out. See MODE SELECTION table. The current  $I_{CC(SB)1}$  is measured for WRITE/READ - ratio of 1/2.

| 28  | RECALL Cycle Time <sup>q</sup>                         | $t_{ELQXR}$ | $t_{d(E)R}$    |      | 20   |      | 20   |      | 20   | $\mu s$ |
| 29  | Address Setup to Chip Enable <sup>r</sup>              | $t_{AVELN}$ | $t_{su(A)SR}$  | 0    |      | 0    |      | 0    |      | ns      |
| 30  | Chip Enable Pulse Width <sup>r, s</sup>                | $t_{ELEHN}$ | $t_{w(E)SR}$   | 20   |      | 25   |      | 35   |      | ns      |
| 31  | Chip Disable to Address Change <sup>r</sup>            | $t_{EHAXN}$ | $t_{h(A)SR}$   | 0    |      | 0    |      | 0    |      | ns      |

n: The software sequence is clocked with  $\bar{E}$  controlled READs.

o: Once the software controlled STORE or RECALL cycle is initiated, it completes automatically, ignoring all inputs.

p: Note that STORE cycles (but not RECALL) are aborted by  $V_{CC} < V_{SWITCH}$  (STORE inhibit).

q: An automatic RECALL also takes place at power up, starting when  $V_{CC}$  exceeds  $V_{SWITCH}$  and takes  $t_{RESTORE}$ .  $V_{CC}$  must not drop below  $V_{SWITCH}$  once it has been exceeded for the RECALL to function properly.

r: Noise on the  $\bar{E}$  pin may trigger multiple READ cycles from the same address and abort the address sequence.

s: If the Chip Enable Pulse Width is less than  $t_{a(E)}$  (see Read Cycle) but greater than or equal  $t_{w(E)SR}$ , then the data may not be valid at the end of the low pulse, however the STORE or RECALL will still be initiated.

## Software Controlled STORE/RECALL Cycle<sup>r, s, t, u</sup> ( $\bar{E}$ = HIGH after STORE initiation)

## Software Controlled STORE/RECALL Cycle<sup>r, s, t, u</sup> ( $\bar{E}$ = LOW after STORE initiation)

t:  $\bar{W}$  must be HIGH when  $\bar{E}$  is LOW during the address sequence in order to initiate a nonvolatile cycle.  $\bar{G}$  may be either HIGH or LOW throughout. Addresses 1 through 6 are found in the mode selection table. Address 6 determines whether the U631H16 performs a STORE or RECALL.

u:  $\bar{E}$  must be used to clock in the address sequence for the Software controlled STORE and RECALL cycles.

## Test Configuration for Functional Check

v: In measurement of  $t_{dis}$ -times and  $t_{en}$ -times the capacitance is 5 pF.

w: Between  $V_{CC}$  and  $V_{SS}$  must be connected a high frequency bypass capacitor 0.1  $\mu$ F to avoid disturbances.

| Capacitance <sup>e</sup> | Conditions                                               | Symbol | Min. | Max. | Unit |
|--------------------------|----------------------------------------------------------|--------|------|------|------|
| Input Capacitance        | $V_{CC} = 5.0 \text{ V}$<br>$V_I = V_{SS}$               | $C_I$  |      | 8    | pF   |
| Output Capacitance       | $f = 1 \text{ MHz}$<br>$T_a = 25 \text{ }^\circ\text{C}$ | $C_O$  |      | 7    | pF   |

All pins not under test must be connected with ground by capacitors.

## Ordering Code

x: on special request

## Device Marking (example)

## Device Operation

The U631H16 has two separate modes of operation: SRAM mode and nonvolatile mode. In SRAM mode, the memory operates as a standard fast static RAM. In nonvolatile mode, data is transferred from SRAM to EEPROM (the STORE operation) or from EEPROM to SRAM (the RECALL operation). In this mode SRAM functions are disabled.

### SRAM READ

The U631H16 performs a READ cycle whenever  $\overline{E}$  and  $\overline{G}$  are LOW while  $\overline{W}$  is HIGH. The address specified on pins A0 - A10 determines which of the 2048 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of  $t_{CR}$ . If the READ is initiated by  $\overline{E}$  or  $\overline{G}$ , the outputs will be valid at  $t_{a(E)}$  or at  $t_{a(G)}$ , whichever is later. The data outputs will repeatedly respond to address changes within the  $t_{CR}$  access time without the need for transition on any control input pins, and will remain valid until another address change or until  $\overline{E}$  or  $\overline{G}$  is brought HIGH or  $\overline{W}$  is brought LOW.

### SRAM WRITE

A WRITE cycle is performed whenever  $\overline{E}$  and  $\overline{W}$  are LOW. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either  $\overline{E}$  or  $\overline{W}$  goes HIGH at the end of the cycle. The data on pins DQ0 - 7 will be written into the memory if it is valid  $t_{su(D)}$  before the end of a  $\overline{W}$  controlled WRITE or  $t_{su(D)}$  before the end of an  $\overline{E}$  controlled WRITE. It is recommended that  $\overline{G}$  is kept HIGH during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If  $\overline{G}$  is left LOW, internal circuitry will turn off the output buffers  $t_{dis(W)}$  after  $\overline{W}$  goes LOW.

### Noise Consideration

The U631H16 is a high speed memory and therefore it must have a high frequency bypass capacitor of approximately 0.1  $\mu$ F connected between  $V_{CC}$  and  $V_{SS}$  using leads and traces that are as short as possible. As with all high speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

### Software Nonvolatile STORE

The U631H16 software controlled STORE cycle is initiated by executing sequential READ cycles from six specific address locations. By relying on READ cycles only, the U631H16 implements nonvolatile operation while remaining compatible with standard 2K x 8 SRAMs. During the STORE cycle, an erase of the previous nonvolatile data is first

performed, followed by parallel programming of all non-volatile elements. Once a STORE cycle is initiated, further inputs and outputs are disabled until the cycle is completed.

Because a sequence of addresses is used for STORE initiation, it is important that no other READ or WRITE accesses intervene in the sequence or the sequence will be aborted and no STORE or RECALL will take place.

To initiate the STORE cycle the following READ sequence must be performed:

- |    |              |     |       |                |
|----|--------------|-----|-------|----------------|
| 1. | Read address | 000 | (hex) | Valid READ     |
| 2. | Read address | 555 | (hex) | Valid READ     |
| 3. | Read address | 2AA | (hex) | Valid READ     |
| 4. | Read address | 7FF | (hex) | Valid READ     |
| 5. | Read address | 0F0 | (hex) | Valid READ     |
| 6. | Read address | 70F | (hex) | Initiate STORE |

Once the sixth address in the sequence has been entered, the STORE cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles are used in the sequence. It is not necessary that  $\overline{G}$  is LOW for the sequence to be valid. After the  $t_{STORE}$  cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

### Software Nonvolatile RECALL

A RECALL cycle of the EEPROM data into the SRAM is initiated with a sequence of READ operations in a manner similar to the STORE initiation. To initiate the RECALL cycle the following sequence of READ operations must be performed:

- |    |              |     |       |                 |
|----|--------------|-----|-------|-----------------|
| 1. | Read address | 000 | (hex) | Valid READ      |
| 2. | Read address | 555 | (hex) | Valid READ      |
| 3. | Read address | 2AA | (hex) | Valid READ      |
| 4. | Read address | 7FF | (hex) | Valid READ      |
| 5. | Read address | 0F0 | (hex) | Valid READ      |
| 6. | Read address | 70E | (hex) | Initiate RECALL |

Internally, RECALL is a two step procedure. First, the SRAM data is cleared and second, the nonvolatile information is transferred into the SRAM cells. The RECALL operation in no way alters the data in the EEPROM cells. The nonvolatile data can be recalled an unlimited number of times.

### Automatic Power Up RECALL

On power up, once  $V_{CC}$  exceeds the sense voltage of  $V_{SWITCH}$ , a RECALL cycle is automatically initiated. The voltage on the  $V_{CC}$  pin must not drop below  $V_{SWITCH}$  once it has risen above it in order for the RECALL to operate properly. Due to this automatic RECALL, SRAM operation cannot commence until  $t_{RESTORE}$  after  $V_{CC}$  exceeds  $V_{SWITCH}$ .

If the U631H16 is in a WRITE state at the end of power up RECALL, the SRAM data will be corrupted. To help avoid this situation, a 10 K $\Omega$  resistor should be connected between  $\overline{W}$  and  $V_{CC}$ .

## Hardware Protection

The U631H16 offers hardware protection against inadvertent STORE operation through  $V_{CC}$  sense. For  $V_{CC} < V_{SWITCH}$  the software initiated STORE operation will be inhibited.

## Low Average Active Power

The U631H16 has been designed to draw significantly less power when  $\overline{E}$  is LOW (chip enabled) but the access cycle time is longer than 55 ns.

When  $\overline{E}$  is HIGH the chip consumes only standby current.

The overall average current drawn by the part depends on the following items:

1. CMOS or TTL input levels
2. the time during which the chip is disabled ( $\overline{E}$  HIGH)
3. the cycle time for accesses ( $\overline{E}$  LOW)
4. the ratio of READs to WRITEs
5. the operating temperature
6. the  $V_{CC}$  level

## О компании

ООО "ТрейдЭлектроникс" - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Наличие собственной эффективной системы логистики обеспечивает надежную поставку продукции по конкурентным ценам в точно указанные сроки.

Срок поставки со стоков в **Европе и Америке – от 3 до 14 дней.**

Срок поставки из **Азии – от 10 дней.**

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Предоставляем спец цены на элементы для создания инженерных сэмплов.

**Упорный труд, качественный результат дают нам право быть уверенными в себе и надежными для наших клиентов.**

### **Наша компания это:**

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование

Наша организация особенно сильна в поставках модулей, микросхем, пассивных компонентов, ксайленсах (XC), EPF, EPM и силовой электроники.

Большой выбор предлагаемой продукции, различные виды оплаты и доставки, позволят Вам сэкономить время и получить максимум выгоды от сотрудничества с нами!

## Перечень производителей, продукцию которых мы поставляем на российский рынок

Trade Electronics.ru

гарантия бесперебойности производства и  
качества выпускаемой продукции

С удовольствием будем прорабатывать для Вас поставки всех необходимых компонентов по текущим запросам для скорейшего выявления групп элементов, по которым сотрудничество именно с нашей компанией будет для Вас максимально выгодным!

С уважением,

Менеджер отдела продаж ООО

«Трейд Электроникс»

Шишлаков Евгений
