

Very Low Noise, High Frequency Active RC, Filter Building Block

FEATURES

- Up to 10MHz Center Frequency on a Single 3V Supply
- Easy to Use—A Single Resistor Value Sets Lowpass Cutoff Frequency ($200\text{kHz} \leq f_c \leq 5\text{MHz}$), Unequal Resistor Values Extend Cutoff Frequency Up to 10MHz
- Extremely Flexible—Different Resistor Values Allow Lowpass Transfer Functions with or Without Gain (Butterworth, Chebyshev or Custom)
- SNR = 92dB ($f_c = 2\text{MHz}$, $2V_{P-P}$)
- THD = -84dB ($f_c = 2\text{MHz}$, $1V_{P-P}$)
- Internal Capacitors Trimmed to $\pm 0.75\%$
- Single 4-Pole Lowpass Filter or **Matched Pair** of 2-Pole Lowpass Filters
- Can be Connected as a Bandpass Filter
- Single-Ended or Differential Output
- Operates from Single 3V (2.7V Min) to $\pm 5V$ Supply
- Rail-to-Rail Input and Output Voltages

APPLICATIONS

- Replaces Discrete RC Active Filters and LC Filter Modules
- Antialiasing/Reconstruction Filters
- Dual or I-and-Q Channels (Two Matched 2nd Order Filters in One Package)
- Single-Ended to Differential Conversion
- Video Signal Processing

DESCRIPTION

The LT[®]1568 is an easy-to-use, active-RC filter building block with rail-to-rail inputs and outputs. The internal capacitors of the IC and the GBW product of the internal low noise op amps are trimmed such that consistent and repeatable filter responses can be achieved. With a single resistor value, the LT1568 provides a pair of **matched** 2-pole Butterworth lowpass filters with unity gain suitable for I/Q channels.

By using unequal-valued external resistors, the two 2-pole sections can create different frequency responses or gains. In addition, the two stages may be cascaded to create a single 4-pole filter with a programmable response. Capable of cutoff frequencies up to 10MHz, the LT1568 is ideal for antialiasing or channel filtering in high speed data communications systems. The LT1568 can also be used as a bandpass filter.

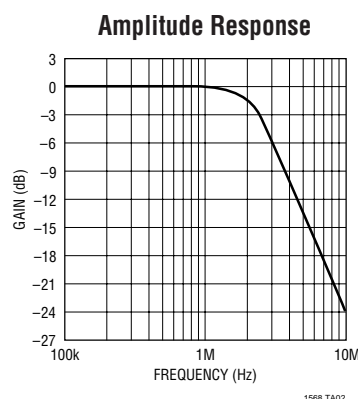

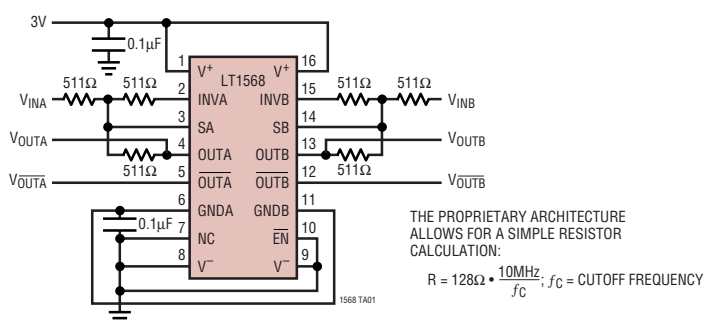

The LT1568 features very low noise, supporting signal-to-noise ratios of over 90dB. It also provides single-ended to differential signal conversion for directly driving high speed A/D converters. The LT1568 has a shutdown mode that reduces supply current to approximately 0.5mA on a 5V supply.

The LT1568 is available in a narrow 16-lead SSOP package.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

Amplitude and Phase Matched Dual Butterworth 2.5MHz Lowpass Filter with Differential Output. Single 3V Supply Operation

ABSOLUTE MAXIMUM RATINGS

(Note 1)

Total Supply Voltage (V^+ to V^-)	11.6V
Input Voltage on INVA, INVB, GNDA and GNDB Pins	V^+ to V^-
Input Current on INVA, INVB, GNDA and GNDB Pins (Note 2)	$\pm 10\text{mA}$
Output Short-Circuit Duration on OUTA, OUTB, OUTA and OUTB Pins	Indefinite
Maximum Continuous Output Current (Note 3) DC	$\pm 100\text{mA}$
Specified Temperature Range (Note 9)	
LT1568C	-40°C to 85°C
LT1568I	-40°C to 85°C
Junction Temperature	150°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 sec)	300°C

FILTER ELECTRICAL CHARACTERISTICS

Specifications are for the *differential output* ($\overline{OUTA} - \overline{OUTA}$ or $\overline{OUTB} - \overline{OUTB}$) of a single 2nd order section (A or B), gain = -2, $R_{FIL} = R11 = R21 = R31 = R12 = R22 = R32$. All voltages are with respect to $V_{GND} = V_{GNDA} = V_{GNDB}$. The ● denotes the specifications which apply over the full operating temperature range, otherwise specifications and typical values are at $T_A = 25^\circ\text{C}$. V_S = single 5V, EN pin to logic "low," $R_{LDIFF} = 800\Omega$ connected to midsupply, unless otherwise noted.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
	Filter Gain Mismatch $ (\overline{V_{OUTA}} - \overline{V_{OUTA}}) - (\overline{V_{OUTB}} - \overline{V_{OUTB}}) $	$f_C = 1\text{MHz}, f_{IN} = f_C$ $f_C = 10\text{MHz}, f_{IN} = f_C$	● ●	-0.3 -0.4	± 0.10 ± 0.15	0.3 0.4 dB
	Wideband Output Noise	$f_C = 1\text{MHz}, R_{FIL} = 1.28\text{k}, \text{BW} = 2\text{MHz}$ $f_C = 10\text{MHz}, R_{FIL} = 128\Omega, \text{BW} = 20\text{MHz}$		36 88		μV_{RMS} μV_{RMS}
THD	Total Harmonic Distortion	$f_C = 1\text{MHz}, R_{FIL} = 1.28\text{k},$ $f_{IN} = 200\text{kHz}, V_{IN} = 1\text{V}_{\text{P-P}}$		-84		dB
		$f_C = 10\text{MHz}, R_{FIL} = 128\Omega,$ $f_{IN} = 2\text{MHz}, V_{IN} = 1\text{V}_{\text{P-P}}$		-69		dB

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: The inputs of each op amp are protected by back-to-back diodes. If either differential input voltage exceeds 1.4V, the input current should be limited to less than 10mA.

Note 3: A heat sink may be required to keep the junction temperature below the absolute maximum rating when the output is shorted indefinitely.

Note 4: The inverter bandwidth is measured with the SA or SB output floating, and is defined as the frequency at which the phase shift from \overline{OUTA} (\overline{OUTB}) to \overline{OUTA} (\overline{OUTB}) drops from 180° to 135° .

Note 5: Measured with the SA or SB output connected in the filter application circuit as shown in the Block Diagram.

Note 6: The common mode input voltage range is measured by shorting the filter input to the common mode reference (\overline{GNDA} or \overline{GNDB}) and applying a DC input voltage to search for the common mode voltage range that creates a $\pm 2\text{mV}$ ($V_S = 3\text{V}$) or $\pm 5\text{mV}$ ($V_S = \pm 5\text{V}$) change in the (\overline{OUTA} or \overline{OUTB}) voltage (measured with respect to \overline{GNDA} or \overline{GNDB}).

Note 7: The minimum cutoff frequency of the LT1568 is arbitrarily listed as 200kHz. The limit is arrived at by setting the maximum resistor value limit at 6.4k. Due to input bias current, the output DC offset through a single section can be as high as 25mV with resistors this large. The LT1568 can be used with even larger resistors if the large offset voltages can be tolerated. For cutoff frequencies below 200kHz, refer to the LTC1563-2, LTC1563-3.

Note 8: With equal-sized resistors, the differential DC gain through either a single section or cascaded sections is 6dB.

Note 9: The LT1568C is guaranteed to meet specified performance from 0°C to 70°C . The LT1568C is designed, characterized and expected to meet specified performance from -40°C to 85°C but is not tested or QA sampled at these temperatures. The LT1568I is guaranteed to meet specified performance from -40°C to 85°C .

PIN FUNCTIONS

V⁺ (Pins 1, 16): The V⁺ positive supply voltage pins should be tied together and bypassed with a 0.1μF capacitor to an adequate analog ground plane using the shortest possible wiring.

INVA, INVB (Pins 2, 15): Inverting Input. Each of the INV pins is an inverting input of an op amp. Note that the INV pins are high impedance, and are susceptible to coupling of unintended signals. External parasitic capacitance on the INV nodes will also affect the frequency response of the filter sections. For these reasons, printed circuit connections to the INV pins must be kept as short as possible.

SA, SB (Pins 3, 14): Summing Pins. These pins are a summing junction for input signals. Stray capacitance on the SA or SB pins may cause “small” frequency errors of the frequency response near the cutoff frequency (or center frequency). The three external resistors for each section should be located as close as possible to the SA or SB pin to minimize stray capacitance (one picofarad of stray capacitance may add up to 0.1% frequency error).

OUTA, OUTB (Pins 4, 13): Lowpass Output. These pins are the rail-to-rail outputs of op amps. Each output is designed to drive a nominal net load of 400Ω and 30pF.

OUTA, OUTB (Pins 5, 12): These pins are the inverted versions of the OUTA and OUTB outputs respectively. Each output is designed to drive a nominal load of 400Ω and 30pF.

GNDA (Pin 6): GNDA serves as the common mode reference voltage for section A. It should be tied to the analog ground plane in a dual supply system. In a single-supply system, an internal resistor divider can be used to establish a half-supply reference point. In that case, GNDA must be bypassed to V⁻ (Pins 8, 9) by a 0.1μF capacitor.

NC (Pin 7): This pin is not connected internally and can be connected to ground.

V⁻ (Pins 8, 9): The V⁻ negative supply voltage pins should be tied together and bypassed to GND by a 0.1μF capacitor in a dual-supply system. In a single-supply system, tie these pins to the ground plane.

EN (Pin 10): ENABLE. When the EN input goes high or is open circuited, the LT1568 enters a shutdown state which reduces the supply current to approximately 0.5mA (V_S = 5V). The OUTA, OUTB, OUTA and OUTB pins assume high impedance states. GNDA will continue to be biased at half-supply. If an input signal is applied to a complete filter circuit while the LT1568 is in shutdown, some signal will normally flow to the output through passive components around the inactive IC.

EN is connected to V⁺ through an internal pull-up resistor of approximately 40k. This defaults the LT1568 to the shutdown state if the EN pin is left floating. Therefore, the user must connect the EN pin to a voltage equal to or less than (V⁺ – 2.1)V to enable the part for normal operation. (For example, if V⁺ is 5V, then to enable the part the EN pin voltage should be 2.9V or less.)

GNDB (Pin 11): GNDB serves as the common mode reference voltage for section B. It should be tied to the analog ground plane in a dual supply system. In a single-supply system, GNDB can be tied to GNDA to set the common mode voltage at half-supply. If it is tied to another reference voltage, GNDB should be bypassed to V⁻ (Pins 8, 9) by a 0.1μF capacitor.

BLOCK DIAGRAM AND TEST CIRCUIT

APPLICATIONS INFORMATION

The LT1568 has been designed to make the implementation of high frequency filtering functions very easy. Internal low noise amplifiers and capacitors are configured in a topology that requires only three external resistors to implement a 2nd order filter stage. The two 2nd order stages can be used independently or cascaded for simple 4th order filter functions. With two stages integrated on the same die, the matching of the independent sections is better than what can be achieved with separate amplifier components.

OPERATING WITH SINGLE OR DUAL SUPPLIES

Figure 1 shows the recommended connection of an analog ground plane with the LT1568 biased from either symmetrical dual ($\pm V$) power supplies or a single supply. Connection of the two GND pins is important to properly DC bias the internal amplifiers. The use of a ground plane helps to minimize noise and stray components to preserve signal integrity and maintain frequency response accuracy.

When biasing from a dual supply, it is recommended that a Schottky diode clamp (BAT54S) be added as shown. These diodes ensure that improper supply voltages, through either reverse polarity or power-up sequencing, do not damage the LT1568.

SIMPLE FILTER IMPLEMENTATIONS

The basic 2nd order filter block of the LT1568, with three external resistors connected as shown in the Block Diagram, has the following lowpass transfer function:

$$\frac{e_{OUT}}{e_{IN}} = - \frac{DC_{GAIN} \cdot (2\pi f_0)^2}{s^2 + \frac{2\pi f_0}{Q} s + (2\pi f_0)^2}$$

where e_{OUT} is either OUTA or OUTB,

$$DC_{GAIN} = \frac{R_2}{R_1}, \quad f_0 = \frac{1}{2\pi \sqrt{R_2 \cdot R_3 \cdot C_1 \cdot C_2}}$$

and

$$Q = \frac{2\pi \cdot C_1 \cdot C_2 \cdot R_1 \cdot R_2 \cdot R_3 \cdot f_0}{C_1 \cdot [R_1 \cdot (R_2 + R_3) + R_2 \cdot R_3] - C_2 \cdot R_1 \cdot R_2}$$

The typical values of the internal capacitors are:

$$C_1 = 105.7\text{pF}$$

$$C_2 = 141.3\text{pF}$$

These filter functions assume ideal amplifiers.

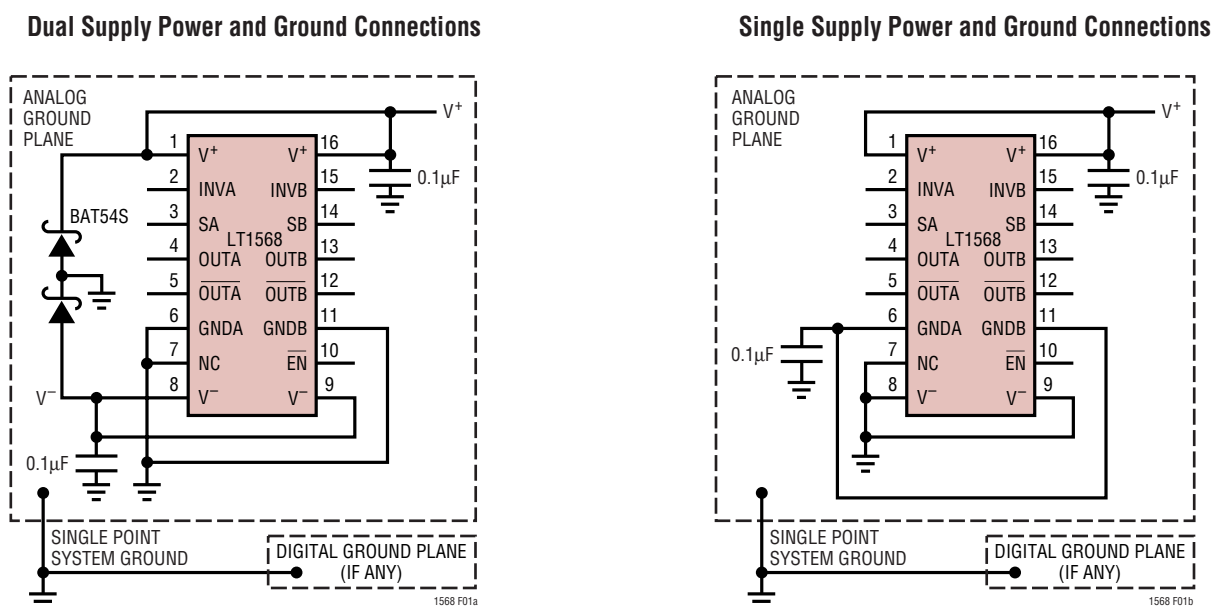

Figure 1. Dual and Single Supply and Ground Plane Connections

APPLICATIONS INFORMATION

The following filter examples are provided to make it easy to design a variety of filter stages. Both 2nd and 4th order filters are shown. For each filter, a table of external resistor values (standard 1% tolerance) is provided. These resistor values have been adjusted to compensate for the finite gain bandwidth product of the LT1568 amplifiers.

To implement a filter, simply connect the resistor values shown in the table for the cutoff frequency desired. If the desired cutoff frequency is not shown in the table of values, use interpolation as recommended in the next section.

DESIGNING FOR ANY CUTOFF FREQUENCY

To implement a lowpass filter with a cutoff frequency not included in the design table, resistor values can be interpolated in the following manner:

For a Cutoff Frequency, f_C , Less Than 1MHz

Start with the resistor values for $f_C = 1\text{MHz}$ and then scale them up by the ratio of $(1\text{MHz}/f_C)$.

Example: Implement a 2nd order lowpass Chebyshev filter with an f_C of 256kHz. From Table 2 the values for f_C of 1MHz are $R_{11} = R_{21} = 976\Omega$ and $R_{31} = 825\Omega$.

Scaling for $f_C = 256\text{kHz}$:

$$R_{11} = R_{21} = 976\Omega \cdot (1\text{MHz}/256\text{kHz}) \approx 3.83\text{k}$$

$$R_{31} = 825\Omega \cdot (1\text{MHz}/256\text{kHz}) \approx 3.24\text{k}$$

For a Cutoff Frequency, f_C , Between Values Given in a Design Table

Start with the resistor values for the cutoff frequency closest to the desired one and scale the values up or down accordingly.

Example: Implement a 2nd order lowpass Chebyshev filter with an f_C of 3.2MHz. From Table 2 the closest values are for f_C of 3MHz and are $R_{11} = R_{21} = 316\Omega$ and $R_{31} = 274\Omega$.

Scaling for $f_C = 3.2\text{MHz}$:

$$R_{11} = R_{21} = 316\Omega \cdot (3\text{MHz}/3.2\text{MHz}) \approx 294\Omega$$

$$R_{31} = 274\Omega \cdot (3\text{MHz}/3.2\text{MHz}) \approx 255\Omega$$

О компании

ООО "ТрейдЭлектроникс" - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Наличие собственной эффективной системы логистики обеспечивает надежную поставку продукции по конкурентным ценам в точно указанные сроки.

Срок поставки со стоков в **Европе и Америке – от 3 до 14 дней.**

Срок поставки из **Азии – от 10 дней.**

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Предоставляем спец цены на элементы для создания инженерных сэмплов.

Упорный труд, качественный результат дают нам право быть уверенными в себе и надежными для наших клиентов.

Наша компания это:

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование

Наша организация особенно сильна в поставках модулей, микросхем, пассивных компонентов, ксайленсах (XC), EPF, EPM и силовой электроники.

Большой выбор предлагаемой продукции, различные виды оплаты и доставки, позволят Вам сэкономить время и получить максимум выгоды от сотрудничества с нами!

Перечень производителей, продукцию которых мы поставляем на российский рынок

Trade Electronics.ru

гарантия бесперебойности производства и
качества выпускаемой продукции

С удовольствием будем прорабатывать для Вас поставки всех необходимых компонентов по текущим запросам для скорейшего выявления групп элементов, по которым сотрудничество именно с нашей компанией будет для Вас максимально выгодным!

С уважением,

Менеджер отдела продаж ООО
