

27C16 16,384-Bit (2048 x 8) UV Erasable CMOS PROM Military Qualified

General Description

The 27C16 is a high speed 16K UV erasable and electrically reprogrammable CMOS EPROM, ideally suited for applications where fast turnaround, pattern experimentation and low power consumption are important requirements.

The 27C16 is packaged in a 24-pin dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written into the device by following the programming procedure.

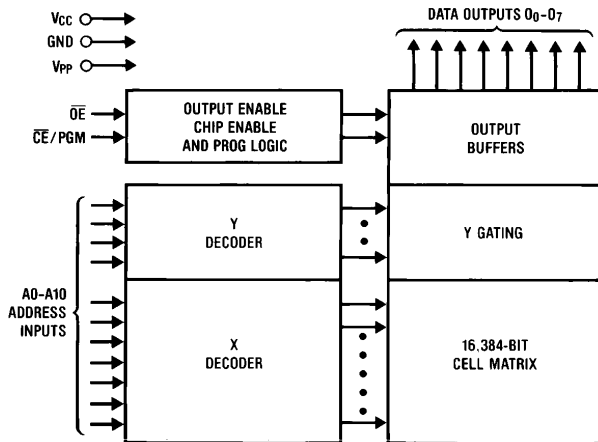

This EPROM is fabricated with the reliable, high volume, time proven, P²CMOS™ silicon gate technology.

The 27C16 specified on this data sheet is fully compliant with MIL-STD-883, Revision C.

Features

- Access time down to 450 ns
- Low CMOS power consumption
 - Active Power: 26.25 mW max
 - Standby Power: 0.53 mW max (98% savings)
- Performance compatible to NSC800™ CMOS micro-processor
- Single 5V power supply
- Pin compatible to MM2716 and higher density EPROMs
- Static—no clocks required
- TTL compatible inputs/outputs
- TRI-STATE® output
- Windowed DIP Package
- Specifications guaranteed over full military temperature range (–55°C to +125°C)

AC Waveforms (Notes 2, 8, 9, 10)

TL/D/10329-3

Note 1: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP} .

Note 3: V_{PP} may be connected to V_{CC} except during programming. $I_{CC1} \leq$ the sum of the I_{CC} active and I_{PP} read currents.

Note 4: Typical values are for $T_A = +25^\circ\text{C}$ and nominal supply voltages.

Note 5: This parameter is only sampled and is not 100% tested.

Note 6: \overline{OE} may be delayed up to $t_{ACC} - t_{OE}$ after the falling edge of \overline{CE} without impact on t_{ACC} .

Note 7: The t_{DF} compare level is determined as follows:
 High to TRI-STATE, the measured V_{OH1} (DC) - 0.10V
 Low to TRI-STATE, the measured V_{OL1} (DC) + 0.10V

Note 8: TRI-STATE may be attained using \overline{OE} or \overline{CE} .

Note 9: The power switching characteristics of EPROMs require careful device decoupling. It is recommended that a 0.1 μF ceramic capacitor be used on every device between V_{CC} and GND.

Note 10: The 27C16 requires one address transition after initial power-up to reset the outputs.

Note 11: The outputs must be restricted to $V_{CC} + 0.3\text{V}$ to avoid latch-up and device damage.

PROGRAMMING CHARACTERISTICS (Note 1)

DC Programming Characteristics (Notes 2 & 3)

($T_A = +25^\circ\text{C} \pm 5^\circ\text{C}$, $V_{CC} = 5\text{V} \pm 10\%$, $V_{PP} = 25\text{V} \pm 1\text{V}$)

| Symbol | Parameter | Conditions | Min | Typ | Max | Units |
|----------|--|-------------------------------------|------|-----|--------------|---------------|
| I_{LI} | Input Current (for Any Input) | $V_{IN} = V_{CC}$ or GND | | | 10 | μA |

Programming Waveforms $V_{PP} = 25V \pm 11V$, $V_{CC} = 5V \pm 5\%$ (Note 3)

TL/D/10329-4

Note: All times shown in parentheses are minimum and in μs unless otherwise specified.

Note 1: National's standard product warranty applies only to devices programmed to specifications described herein.

Note 2: V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP} . The 27C16 must not be inserted into or removed from a board with V_{PP} at $25V \pm 1V$ to prevent damage to the device.

Note 3: The maximum allowable voltage which may be applied to the V_{PP} pin during programming is 26V. Care must be taken when switching the V_{PP} supply to prevent overshoot exceeding this 26V maximum specification. A 0.1 μF capacitor is required across V_{PP} , V_{CC} to GND to suppress spurious voltage transients which may damage the device.

Functional Description

DEVICE OPERATION

The six modes of operation of the 27C16 are listed in Table I. It should be noted that all inputs for the six modes are at TTL levels. The power supplies required are a 5V V_{CC} and a V_{PP} . The V_{PP} power supply must be at 25V during the three programming modes, and must be at 5V in the other three modes.

Read Mode

The 27C16 has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable (\overline{CE}) is the power control and should be used for device selection. Output Enable (\overline{OE}) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that addresses are stable, address access time (t_{ACC}) is equal to the delay from \overline{CE} to output (t_{CE}). Data is available at the outputs t_{OE} after the falling edge of \overline{OE} , assuming that \overline{CE} has been low and addresses have been stable for at least $t_{ACC} - t_{OE}$. The 27C16 requires one address transition after initial power-up to reset the outputs.

Standby Mode

The 27C16 has a standby mode which reduces the active power dissipation by 98%, from 26.25 mW to 0.53 mW. The 27C16 is placed in the standby mode by applying a TTL high signal to the \overline{CE} input. When in standby mode, the outputs are in a high impedance state, independent of the \overline{OE} input.

Output OR-Tying

Because 27C16s are usually used in larger memory arrays, National has provided a 2-line control function that accommodates this use of multiple memory connections. The 2-line control function allows for:

a) the lowest possible memory power dissipation, and

b) complete assurance that output bus contention will not occur.

To most efficiently use these two control lines, it is recommended that \overline{CE} (pin 18) be decoded and used as the primary device selecting function, while \overline{OE} (pin 20) be made a common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low power standby modes and that the output pins are active only when data is desired from a particular memory device.

Programming

CAUTION: Exceeding 26.5V on pin 21 (V_{PP}) will damage the 27C16.

Initially, and after each erasure, all bits of the 27C16 are in the "1" state. Data is introduced by selectively programming "0s" into the desired bit locations. Although only "0s" will be programmed, both "1s" and "0s" can be presented in the data word. The only way to change a "0" to a "1" is by ultraviolet light erasure.

The 27C16 is in the programming mode when the V_{PP} power supply is at 25V and \overline{OE} is at V_{IH} . It is required that a 0.1 μF capacitor be placed across V_{PP} , V_{CC} to ground to suppress spurious voltage transients which may damage the device. The data to be programmed is applied 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL.

When the address and data are stable, a 50 ms, active high, TTL program pulse is applied to the \overline{CE}/PGM input. A program pulse must be applied at each address location to be programmed. You can program any location at any time—either individually, sequentially, or at random. The program pulse has a maximum width of 55 ms. The 27C16 must not be programmed with a DC signal applied to the \overline{CE}/PGM input.

Functional Description (Continued)

Programming multiple 27C16s in parallel with the same data can be easily accomplished due to the simplicity of the programming requirements. Like inputs of the paralleled 27C16s may be connected together when they are programmed with the same data. A high level TTL pulse applied to the \overline{CE} /PGM input programs the paralleled 27C16s.

Program Inhibit

Programming multiple 27C16s in parallel with different data is also easily accomplished. Except for \overline{CE} /PGM, all like inputs (including \overline{OE}) of the parallel 27C16s may be common. A TTL level program pulse applied to an 27C16's \overline{CE} /PGM input with V_{PP} at 25V will program that 27C16. A low level \overline{CE} /PGM input inhibits the other 27C16 from being programmed.

Program Verify

A verify should be performed on the programmed bits to determine whether they were correctly programmed. The verify may be performed with V_{PP} at 25V. V_{PP} must be at V_{CC} , except during programming and program verify.

ERASURE CHARACTERISTICS

The erasure characteristics of the 27C16 are such that erasure begins to occur when exposed to light with wavelengths shorter than approximately 4000 Angstroms (Å). It should be noted that sunlight and certain types of fluorescent lamps have wavelengths in the 3000Å–4000Å range. Opaque labels should be placed over the 27C16 window to prevent unintentional erasure. Covering the window will also prevent temporary functional failure due to the generation of photo currents.

The recommended erasure procedure for the 27C16 is exposure to short wave ultraviolet light which has a wavelength of 2537 Angstroms (Å). The integrated dose (i.e., UV intensity \times exposure time) for erasure should be a minimum of 15W-sec/cm². The erasure time with this dosage is approximately 21 minutes using an ultraviolet lamp with a

12,000 μ W/cm² power rating. The 27C16 should be placed within 1 inch of the lamp tubes during erasure. Some lamps have a filter on their tubes which should be removed before erasure.

Note: The 27C16-550 may take up to 60 minutes for complete erasure to occur.

An erasure system should be calibrated periodically. The distance from lamp to unit should be maintained at one inch. The erasure time increases as the square of the distance. (If distance is doubled the erasure time increases by a factor of 4.) Lamps lose intensity as they age. When a lamp is changed, the distance has changed, or the lamp has aged, the system should be checked to make certain full erasure is occurring. Incomplete erasure will cause symptoms that can be misleading. Programmers, components, and even system designs have been erroneously suspected when incomplete erasure was the problem.

SYSTEM CONSIDERATION

The power switching characteristics of EPROMs require careful decoupling of the devices. The supply current, I_{CC} , has three segments that are of interest to the system designer—the standby current level, the active current level, and the transient current peaks that are produced on the falling and rising edges of chip enable. The magnitude of these transient current peaks is dependent on the output capacitance loading of the device. The associated transient voltage peaks can be suppressed by properly selected decoupling capacitors. It is recommended that a 0.1 μ F ceramic capacitor be used on every device between V_{CC} and GND. This should be a high frequency capacitor of low inherent inductance. In addition, a 4.7 μ F bulk electrolytic capacitor should be used between V_{CC} and GND for each eight devices. The bulk capacitor should be located near where the power supply is connected to the array. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of the PC board traces.

TABLE I. Mode Selection

| Mode | Pins | \overline{CE} /PGM (18) | \overline{OE} (20) | V_P (21) | V_{CC} (24) | Outputs (9–11, 13–17) |
|-----------------|------|------------------------------|-------------------------|---------------|------------------|--------------------------|
| Read | | V_{IL} | V_{IL} | V_{CC} | 5 | D_{OUT} |
| Standby | | V_{IH} | Don't Care | V_{CC} | 5 | Hi-Z |

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

О компании

ООО "ТрейдЭлектроникс" - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Наличие собственной эффективной системы логистики обеспечивает надежную поставку продукции по конкурентным ценам в точно указанные сроки.

Срок поставки со стоков в **Европе и Америке – от 3 до 14 дней.**

Срок поставки из **Азии – от 10 дней.**

Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Предоставляем спец цены на элементы для создания инженерных сэмплов.

Упорный труд, качественный результат дают нам право быть уверенными в себе и надежными для наших клиентов.

Наша компания это:

- Гарантия качества поставляемой продукции
- Широкий ассортимент
- Минимальные сроки поставок
- Техническая поддержка
- Подбор комплектации
- Индивидуальный подход
- Гибкое ценообразование

Наша организация особенно сильна в поставках модулей, микросхем, пассивных компонентов, ксайленсах (XC), EPF, EPM и силовой электроники.

Большой выбор предлагаемой продукции, различные виды оплаты и доставки, позволят Вам сэкономить время и получить максимум выгоды от сотрудничества с нами!

Перечень производителей, продукцию которых мы поставляем на российский рынок

С удовольствием будем прорабатывать для Вас поставки всех необходимых компонентов по текущим запросам для скорейшего выявления групп элементов, по которым сотрудничество именно с нашей компанией будет для Вас максимально выгодным!

С уважением,

Менеджер отдела продаж ООО

«Трейд Электроникс»

Шишлаков Евгений
